最新的 ISA Cybersecurity ISA-IEC-62443 免費考試真題 (Q154-Q159):

問題 #154

Why is OPC Classic considered firewall unfriendly?

Available Choices (select all choices that are correct)

- A. OPC Classic uses DCOM, which dynamically assigns any port between 1024 and 65535.
- B. OPC Classic is allowed to use only port 80.
- C. OPC Classic is an obsolete communication standard.
- D. OPC Classic works with control devices from different manufacturers.

答案：A

問題 #155

Which is the PRIMARY reason why Modbus over Ethernet is easy to manage in a firewall?

Available Choices (select all choices that are correct)

- A. Modbus is a proprietary protocol that is widely supported by vendors.
- B. Modbus uses a single master to communicate with multiple slaves using simple commands.
- C. Modbus uses explicit source and destination IP addresses and a single known TCP port.
- D. Modbus has no known security vulnerabilities, so firewall rules are simple to implement.

答案： C

問題 #156

A manufacturing plant has inconsistent cybersecurity processes that vary widely between shifts and teams. According to the maturity levels described in ISA/IEC 62443-2-1, how would this situation be classified?

- A. Level 4 - Improving (quantitatively managed)
- **B. Level 1 - Initial (ad-hoc and undocumented processes)**
- C. Level 3 - Defined / Practiced (repeatable and documented processes)
- D. Level 2 - Managed (documented procedures and training programs)

答案： B

解題說明：

The ISA/IEC 62443-2-1 standard introduces Security Program Maturity Levels, which help assess how well an organization has integrated security into its industrial operations. Level 1 is the "Initial" stage where processes are ad-hoc, undocumented, and vary across the organization - precisely the case described in the question.

"Maturity Level 1 (Initial) - Processes are ad hoc and undocumented. There is no consistency in how security is implemented across the organization or teams. Security activities are performed inconsistently, typically in response to incidents."

- ISA/IEC 62443-2-1:2010, Table 4 - Maturity Levels

The inconsistency between shifts and teams indicates a lack of standardized procedures, which is a hallmark of Level 1.

問題 #157

Which is a physical layer standard for serial communications between two or more devices?

Available Choices (select all choices that are correct)

- A. RS235
- **B. RS232**
- C. RS435
- D. RS432

答案： B

解題說明：

RS232 is a physical layer standard for serial communication between two or more devices. It defines the electrical characteristics, timing, and pinout of connectors for serial data transmission. RS232 is widely used in industrial communication devices, such as PLCs, measuring instruments, and network servers. RS232 allows only one master and one slave to communicate on each line, and operates in a full duplex mode. RS232 has lower transmission speed, shorter maximum cable length, and larger voltage swing than later standards such as RS422 and RS485.
