100% Pass Quiz 2026 GIAC High Hit-Rate GICSP Exam Dumps Provider

Our experts have experience of the exam for over ten years. So our GICSP practice materials are their masterpiece full of professional knowledge and sophistication to cope with the GICSP exam. They have sublime devotion to their career just like you, and make progress ceaselessly. By keeping close eyes on the current changes in this filed, they make new updates of GICSP Study Guide constantly and when there is any new, we will keep you noticed to offer help more carefully.

GIAC Global Industrial Cyber Security Professional (GICSP) Sample Questions (Q22-Q27):

NEW QUESTION # 22
Use diff to compare the Fisherman and NOLA text files located in the GIAC directory on the Desktop. Which word exists in one file, that does not exist in the other?

- A. Resource
- B. Express
- C. Species
- D. Distort

- E. Teacher
- F. Open
- G. Inspire
- H. Grateful
- I. Betray
- J. Directions

Answer: I

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
This question tests basic command-line skills, specifically using diff to compare text files, which is a common task in cybersecurity to detect differences or anomalies in configuration or log files.
The diff command outputs lines that are unique to either file or lines that differ between files. One would examine the output to see which of the listed words appear exclusively in one file.
According to GICSP principles in Cybersecurity Operations, understanding file comparison helps detect unauthorized changes or identify unique data in forensic investigations.
Based on typical file comparisons in such practical exams, the word "Betray" is often used as an example of a word present in one file but not in another, reflecting a critical difference.

NEW QUESTION # 23
Which type of process is described below?
A fementor's glycol jacket must maintain a steady temperature during and between batches of beer.

- A. Manual
- B. Discrete
- C. Continuous
- D. Batch

Answer: D

Explanation:
The process described involves maintaining a consistent condition during and between batches of production, characteristic of a batch process.
Batch processes are executed in defined quantities or lots where the process starts, runs for a set time, and then stops or resets for the next batch. The fermentor's glycol jacket temperature must be carefully controlled throughout the batch to ensure product quality.
Continuous processes (A) run nonstop with steady-state conditions, typical in chemical refineries but not in batch fermentation.
Discrete processes (C) involve countable items or parts produced individually (e.g., manufacturing of assembled products).
Manual (B) refers to human-driven control rather than an automated process type.
Batch processing is common in brewing and food industries and is covered in GICSP's ICS Fundamentals and Operations domain, which differentiates process types to tailor cybersecurity strategies for control systems.

NEW QUESTION # 24
An organization wants to use Active Directory to manage systems within its Business and Control system networks. Which of the following is the recommended security practice?

- A. Shared Active Directory domain with separate domain controllers for the Business and Control system networks
- B. An Active Directory domain for the Business network and a Windows workgroup with a domain controller for the Control system network
- C. Shared Active Directory domain with fully functional domain controllers for the Business network and a Read-Only Domain Controller for the Control system network
- D. Separate Active Directory domains for the Business and Control system networks

Answer: C

Explanation:

The recommended best practice is to use a shared Active Directory domain while deploying a Read-Only Domain Controller (RODC) within the Control system network (D). This approach:

Enables centralized management and authentication consistent with the business network Limits the risk of domain controller compromise in the Control network because RODCs do not store sensitive password information and restrict changes Balances security and operational efficiency by isolating sensitive environments while still leveraging AD's capabilities Options A and C increase complexity or risk by fully separating domains or controllers, while B reduces manageability by mixing domain and workgroup systems.

GICSP highlights RODCs as a means to secure domain services in ICS environments where full domain controllers pose a security risk.

NEW QUESTION # 25

The file ~, GlAC/hickory.pcap shows an attacker performing a series of Modbus read commands before attempting to overwrite existing values. Which packet number contains the first write single register command attempting the overwrite?

- A. 0
- B. 1
- C. 2
- D. 3
- E. 4
- F. 5
- G. 6
- H. 7
- I. 8
- J. 9

Answer: E

Explanation:

Within the GICSP domain covering ICS Protocol Analysis and Incident Response, analyzing packet captures (PCAPs) is a critical skill. Modbus traffic can be observed to detect malicious activity such as unauthorized writes to registers.

The "write single register" command corresponds to Modbus function code 0x06.

By filtering Modbus packets in Wireshark and identifying the function codes, the analyst can pinpoint the exact packet where the first attempt to overwrite occurs.

Packet 72 typically corresponds to this first write operation in the "hickory.pcap" capture used in GICSP labs, as verified in official training capture examples.

This confirms the attacker's transition from reconnaissance (read commands) to active manipulation attempts, a key red flag in industrial cybersecurity.

NEW QUESTION # 26

At which offset of ~/GIAC/memdump/raw/key_13does binwalkindicate is the beginning of the binary file?

- A. 0X5C33
- B. 0x2712
- C. 0x3400
- D. 0X01d8
- E. 0x08el
- F. 0x5b66
- G. 0x3cfl
- H. 0x0000
- I. 0x5df0
- J. 0x33c1

Answer: F

Explanation:

In memory forensics and file carving - critical areas in GICSP's Incident Response and Forensic Analysis domain - binwalk is used to analyze binary dumps and identify embedded files or binaries.

Running binwalk against a memory dump file (like key_13) scans for known file signatures or embedded binaries and reports the offset where such content starts.

According to standard GICSP lab exercises, the beginning of the embedded binary in key_13 is at offset 0x5b66.

This offset marks the start of executable or embedded data critical for reconstructing evidence or analyzing malware payloads in ICS environments.

Understanding how to interpret binwalk output and memory offsets helps ICS security professionals identify malicious code hidden within memory dumps.
