## NVIDIA-Certified Professional: OpenUSD Development (NCP-OUSD) Sample Questions (Q19-Q24):

### NEW QUESTION # 19

What is the role of lofting in relation to payloads?

- A. It disables sublayers
- B. It encrypts payloaded data
- C. It makes important fields visible above the payload
- D. It moves heavy geometry into memory

**Answer: C**

Explanation:

Lofting surfaces important attributes (like primvars, extentsHint, or variant sets) so they remain discoverable even when the payload is unloaded.

### NEW QUESTION # 20

What is the best prim type for organizing hierarchies without adding transform semantics?

- A. Xform
- B. Mesh
- C. Scope
- D. Material

**Answer: C**

Explanation:

Scope prims provide logical grouping without introducing transformations like Xforms.

### NEW QUESTION # 21

What is the fundamental data type in USD that enables API schemas to be non-destructively removed in stronger layers?

- A. booleans
- B. arrays
- C. list ops

**Answer: C**

Explanation:

The correct answer is list ops . API schemas are not encoded as a simple boolean flag on a prim. Instead, applied API schemas are stored in the apiSchemas metadata as token-valued listOp data. OpenUSD's UsdPrim::ApplyAPI() documentation states that applying an API schema stores the schema name by adding it to the token-valued listOp metadata apiSchemas. Its RemoveAPI() documentation states that removing an API schema authors an explicit deletion of that schema name from the same listOp metadata. This is what enables non-destructive removal in stronger layers. A weaker layer may apply an API schema, while a stronger layer can delete that schema token from the composed list without modifying the weaker source layer. NVIDIA's OpenUSD glossary describes list editing as sparse ordered-list composition using operations such as prepend, append, delete, and explicit replacement, allowing stronger layers to modify lists contributed by weaker layers.

Option B is incorrect because arrays store values but do not provide list-edit composition semantics. Option C is incorrect because booleans cannot represent ordered additive and subtractive composition. This aligns with Customizing USD # API Schemas, apiSchemas Metadata, List Editing, and Non-Destructive Layering .

### NEW QUESTION # 22

Which integrity check is essential for faces?

- A.  $\text{len}(\text{primvars:st}) == \text{len}(\text{faceVertexCounts})$
- B.  $\text{len}(\text{points}) == \text{len}(\text{normals})$  always

- C. `sum(faceVertexCounts) == len(faceVertexIndices)`
- D. `len(points) == len(faceVertexCounts)`

**Answer: B**

Explanation:

Counts must match the flattened index list.

### NEW QUESTION # 23

Why use sublayers in large scenes?

- A. To reduce rendering quality
- B. To enforce destructive edits
- C. To automatically delete old prims
- D. To allow parallel work on separate aspects like lighting and geometry

**Answer: D**

Explanation:

Sublayers enable workstreams (lighting, geometry, etc.) to work independently.
