Many candidates have prepared from the actual Palo Alto Networks XSIAM-Analyst Practice Questions and rated them as the best to study for the examination and pass it in a single try with the best score. The Palo Alto Networks XSIAM-Analyst practice material of TorrentVCE came into existence after consultation with many professionals and getting their positive reviews.

Palo Alto Networks XSIAM Analyst Sample Questions (Q80-Q85):

NEW QUESTION # 80
In the Endpoint Data context menu of the Cortex XSIAM endpoints table, where will an analyst be able to determine which users accessed an endpoint via Live Terminal?

- A. View Incidents
- B. View Actions
- C. View Endpoint Logs
- D. View Endpoint Policy

Answer: B

Explanation:
The correct answer is D - View Actions.
Within the Cortex XSIAM Endpoints table, the View Actions context menu allows analysts to review historical actions performed on an endpoint, including Live Terminal access. This menu logs all actions such as isolations, scans, and terminal sessions, along with the

user who initiated each action, making it the source for tracking who accessed the endpoint via Live Terminal.
"The View Actions option in the endpoints table displays a history of all performed actions, including Live Terminal sessions and the corresponding users." Document Reference:EDU-270c-10-lab-guide_02.docx (1).pdf Page:Page 13 (Agent Deployment and Configuration section)

NEW QUESTION # 81
Which configuration will ensure any alert involving a specific critical asset will always receive a score of 100?

- A. A risk scoring policy for the critical asset
- B. A user scoring rule for the critical asset
- C. An asset as critical in Asset Inventory
- D. SmartScore to apply the specific score to the critical asset

Answer: A

Explanation:
The correct answer isD, a risk scoring policy for the critical asset.
In Cortex XSIAM, to consistently apply a high score (e.g., 100) to any alert involving a particular asset, analysts should define and apply a risk scoring policy. Such policies allow organizations to specifically customize and enforce a scoring framework to reflect the critical nature of certain assets, ensuring they are always prioritized during incident response activities.
* Asset criticality alone (option A) doesn't automatically assign a static high score to every alert.
* SmartScore (option B) is AI-driven and dynamic; it cannot guarantee a fixed, always-maximized score.
* User scoring rules (option C) target user entities, not specifically the assets themselves.
"Risk scoring policies are explicitly defined to consistently assign specific scores to incidents or alerts involving critical assets, ensuring prioritized visibility in the incident queue."

NEW QUESTION # 82
You notice certain threat types are under-prioritized. What two customizations can address this?
Response:

- A. Add alert field conditions in scoring policy
- B. Tag alerts as "Suppressed"
- C. Adjust scoring weights by alert name
- D. Reconfigure BIOC severity

Answer: A,C

NEW QUESTION # 83
Which attribution evidence will have the lowest confidence level when evaluating assets to determine if they belong to an organization's attack surface?

- A. An asset attributed to the organization because the Subject Organization field contains the company name
- B. An asset discovered through registration information attributed to the organization
- C. An asset manually approved by a Cortex Xpanse analyst
- D. An asset attributed to the organization because the name server domain contains the company domain

Answer: A

Explanation:
The correct answer isC - An asset attributed to the organization because the Subject Organization field contains the company name.
When determining ownership of assets in the attack surface, attribution based solely on the Subject Organization field containing the company name is considered less reliable than evidence based on domain registration, authoritative DNS relationships, or manual analyst validation. This is because the Subject Organization field may contain non-unique or common names, leading to a higher rate of false associations, and is not as strong as direct registration records or explicit analyst verification.
"The confidence level is lowest when asset attribution is based on the Subject Organization field, since this field may not be unique to the organization and can result in inaccurate mapping." Document Reference:XSIAM Analyst ILT Lab Guide.pdf Page:Page 42 (Attack Surface Management section)

Based on the artifact details in the image below, what can an analyst infer from the hexagon-shaped object with the exclamation mark (!) at the center?

- A. The artifact verdict has changed from a previous state to "Malware."
- B. The malware requires further analysis.
- C. The malicious artifact was injected.
- D. The WildFire verdict returned is "Low Confidence."

Answer: A

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
The correct answer isB - The artifact verdict has changed from a previous state to "Malware." Thehexagon-shaped object with an exclamation markin Cortex XSIAM artifact analysis indicates achange or escalation in verdict-typically from "Unknown" or another previous state to "Malware." This symbol is a visual cue for analysts to pay attention to the updated status, as the system has reclassified the file/object to
"Malware" based on new intelligence or analysis.
"The exclamation mark in a hexagon is used to signal that the verdict of the artifact has changed, most commonly to indicate a new classification as 'Malware.'" Document Reference:XSIAM Analyst ILT Lab Guide.pdf Page:Page 37 (Threat Intel Management section, Artifact verdict/status changes)

......
