New SPLK-2002 Exam Pdf | SPLK-2002 Test Preparation

The most interesting thing about the learning platform is not the number of questions, not the price, but the accurate analysis of each year's exam questions. Our SPLK-2002 study materials through the analysis of each subject research, found that there are a lot of hidden rules worth exploring, this is very necessary, at the same time, our SPLK-2002 Study Materials have a super dream team of experts, so you can strictly control the proposition trend every year.

Splunk SPLK-2002 exam is a challenging but rewarding certification exam for IT professionals who are looking to validate their expertise in Splunk Enterprise. It is a key requirement for obtaining the Splunk Enterprise Certified Architect certification and is recognized globally as a demonstration of an individual's advanced knowledge and skill in Splunk Enterprise.

Once you have passed the Splunk SPLK-2002 Exam, you will be certified as a Splunk Enterprise Certified Architect. Splunk Enterprise Certified Architect certification will demonstrate to potential employers that you have the skills and knowledge necessary to manage and analyze data using Splunk. It will also give you access to a community of certified professionals who can provide support and guidance as you continue to work with Splunk.

Splunk Enterprise Certified Architect Sample Questions (Q76-Q81):

NEW QUESTION # 76

Which of the following are client filters available in serverclass.conf? (Select all that apply.)

- A. IP address.
- B. Platform (machine type).
- C. DNS name.
- D. Splunk server role.

Answer: A,B,C

Explanation:

The client filters available in `serverclass.conf` are DNS name, IP address, and platform (machine type). These filters allow the administrator to specify which forwarders belong to a server class and receive the apps and configurations from the deployment server. The Splunk server role is not a valid client filter in `serverclass.conf`, as it is not a property of the forwarder. For more information, see [Use forwarder management filters] in the Splunk documentation.

NEW QUESTION # 77

A three-node search head cluster is skipping a large number of searches across time. What should be done to increase scheduled search capacity on the search head cluster?

- A. Change `limits.conf` value for `max_searches_per_cpu` to a higher value.
- B. Create a job server on the cluster.
- C. `server.conf` `captain_is_adhoc_searchhead = true`.
- D. Add another search head to the cluster.

Answer: A

NEW QUESTION # 78

How does IT Service Intelligence (ITSI) impact the planning of a Splunk deployment?

- A. ITSI in a Splunk deployment does not require additional hardware resources.
- B. ITSI requires a dedicated deployment server.
- C. The amount of users using ITSI will not impact performance.
- D. Depending on the Key Performance Indicators that are being tracked, additional infrastructure may be needed.

Answer: D

Explanation:

Explanation

ITSI can impact the planning of a Splunk deployment depending on the Key Performance Indicators (KPIs) that are being tracked. KPIs are metrics that measure the health and performance of IT services and business processes. ITSI collects, analyzes, and displays KPI data from various data sources in Splunk. Depending on the number, frequency, and complexity of the KPIs, additional infrastructure may be needed to support the data ingestion, processing, and visualization. ITSI does not require a dedicated deployment server, nor does it affect the number of users using ITSI. ITSI in a Splunk deployment does require additional hardware resources, such as CPU, memory, and disk space, to run the ITSI components and apps

NEW QUESTION # 79

In a four site indexer cluster, which configuration stores two searchable copies at the origin site, one searchable copy at site2, and a total of four searchable copies?

- A. `site_search_factor = origin:2, site2:1, total:4`
- B. `site_replication_factor = origin:2, site2:1, total:4`
- C. `site_replication_factor = origin:2, site1:2, total:4`
- D. `site_search_factor = origin:2, site1:2, total:4`

Answer: A

Explanation:

In a four site indexer cluster, the configuration that stores two searchable copies at the origin site, one searchable copy at site2, and a total of four searchable copies is `site_search_factor = origin:2, site2:1, total:4`.

This configuration tells the cluster to maintain two copies of searchable data at the site where the data originates, one copy of
