New Identity-and-Access-Management-Architect Dumps Ppt, Learning Identity-and-Access-Management-Architect Mode
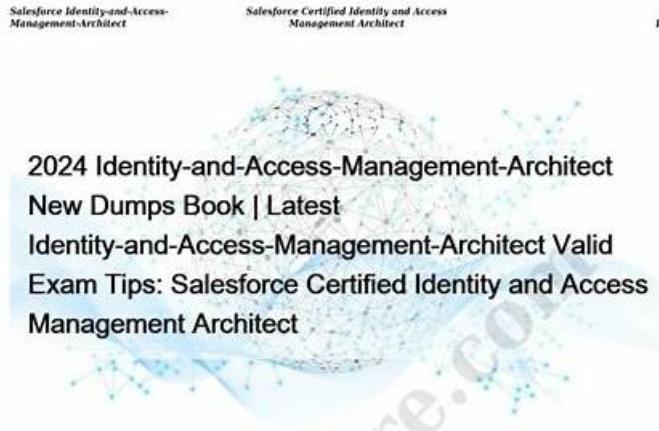

P.S. Free 2025 Salesforce Identity-and-Access-Management-Architect dumps are available on Google Drive shared by ValidExam: https://drive.google.com/open?id=1cofcFIdpv45nl1gMbEqL9Sxzz8TMd7fQ

This Salesforce PDF file is a really convenient and manageable format. Furthermore, the Salesforce Identity-and-Access-Management-Architect PDF is printable which enables you to study or revise questions on the go. This can be helpful since staring at a screen during long study hours can be tiring and the Identity-and-Access-Management-Architect PDF hardcopy format is much more comfortable. And this Salesforce Certified Identity and Access Management Architect price is affordable.

Salesforce Certified Identity and Access Management Architect certification exam covers a broad range of topics related to IAM, including identity management, access management, data protection, and compliance. Candidates must demonstrate their knowledge of core IAM concepts, such as user provisioning, authentication, authorization, and single sign-on. They must also have a deep understanding of how to configure and use Salesforce's IAM tools, such as Identity Connect, Salesforce Identity, and Salesforce Shield.

Identity-and-Access-Management-Architect Certification Test Answers

We have considered that your time may be very tight, and you can only use some fragmented time to learn. Therefore, it is really important to be able to read our Identity-and-Access-Management-Architect study materials anytime, anywhere. So we have developed our Identity-and-Access-Management-Architect exam questions to three different versions: the PDF, Software and APP online. They have covered all conditions that you will be in to study on our Identity-and-Access-Management-Architect learning guide. For example, the time you want to study on phone, computer, laptop, paper and so on.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q26-Q31):

NEW QUESTION # 26
A global company's Salesforce Identity Architect is reviewing its Salesforce production org login history and is seeing some intermittent Security Assertion Markup Language (SAML SSO) 'Replay Detected and Assertion Invalid' login errors.
Which two issues would cause these errors?
Choose 2 answers

- A. The certificate loaded into SSO configuration does not match the certificate used by the IdP.
- B. The assertion sent to 5alesforce contains an assertion ID previously used.
- C. The current time setting of the company's identity provider (IdP) and Salesforce platform is out of sync by more than eight minutes.
- D. The subject element is missing from the assertion sent to salesforce.

Answer: B,D

NEW QUESTION # 27
Universal Containers (UC) wants its users to access Salesforce and other SSO-enabled applications from a custom web page that UC magnets. UC wants its users to use the same set of credentials to access each of the applications. what SAML SSO flow should an Architect recommend for UC?

- A. User-Agent
- B. IdP-Initiated
- C. SP-Initiated
- D. SP-Initiated with Deep Linking

Answer: B

Explanation:
The SAML SSO flow that an architect should recommend for UC is IdP-initiated. IdP-initiated SSO is a process that allows users to start at the IdP site, such as UC's custom web page, and then be redirected to Salesforce or other SPs with a SAML assertion that contains information about the user's identity and attributes. This flow enables UC to provide a single point of entry for its users to access multiple applications with the same credentials, as they do not need to enter their username and password again for each application. This flow also simplifies the configuration and maintenance of SSO, as UC does not need to create or manage deep links or URLs for each application.
The other options are not valid SAML SSO flows for this scenario. SP-initiated with deep linking is a process that allows users to start at a specific resource on the SP site, such as a report or dashboard, and then be redirected to the IdP for authentication and back to the resource with a SAML assertion. This flow is not suitable for UC's scenario, as they want their users to start at their custom web page, not at a specific resource on Salesforce or other SPs. SP-initiated is a process that allows users to start at the SP site, such as Salesforce or other applications, and then be redirected to the IdP for authentication and back to the SP site with a SAML assertion. This flow is not suitable for UC's scenario, as they want their users to start at their custom web page, not at each application separately. User-agent is not a standard term for SAML SSO, but it could refer to user-agent flow, which is an OAuth authorization flow that allows users to obtain an access token from Salesforce by using a browser or web-view. This flow is not suitable for UC's scenario, as it does not use SAML or IdP for authentication. NEW QUESTION # 28
Northern Trail Outfitters (NTO) is planning to roll out a partner portal for its distributors using Experience Cloud. NTO would like to use an external identity provider (idP) and for partners to register for access to the portal. Each partner should be allowed to

register only once to avoid duplicate accounts with Salesforce.
What should a identity architect recommend to create partners?

- A. Allow partners to register through the IdP and create partner users in Salesforce through an API.
- B. Create a custom web page in the Portal and create users in the IdP and Experience Cloud using published APIs.
- C. Create a custom page m Experience Cloud to self register partner with Experience Cloud and Ping identity store.
- D. On successful creation of Partners using Self Registration page in Experience Cloud, create identity in Ping.

Answer: C

Explanation:
Explanation
To create partners using an external identity provider (IdP) and avoid duplicate accounts with Salesforce, the identity architect should recommend creating a custom page in Experience Cloud to self register partner with Experience Cloud and Ping identity store. Ping is an IdP that supports OpenID Connect protocol, which allows users to sign in with an external identity provider and access Salesforce resources. By creating a custom page in Experience Cloud, the identity architect can use a custom registration handler to link the partner's Ping identity with their Salesforce identity and prevent duplicate accounts. The custom page can also provide a seamless user experience for the partners. NEW QUESTION # 29
Which two are valid choices for digital certificates when setting up two-way SSL between Salesforce and an external system.
Choose 2 answers

- A. Use a trusted CA-signed certificate for salesforce and a trusted CA-signed cert for the external system
- B. Use a self-signed certificate for salesforce and a self-signed cert for the external system
- C. Use a trusted CA-signed certificate for salesforce and a self-signed cert for the external system
- D. Use a self-signed certificate for salesforce and a trusted CA-signed cert for the external system

Answer: B,D

Explanation:
Explanation
Two-way SSL is a method of mutual authentication between two parties using digital certificates. A digital certificate is an electronic document that contains information about the identity of the certificate owner and a public key that can be used to verify their signature. A digital certificate can be either self-signed or CA-signed. A self-signed certificate is created and signed by its owner, while a CA-signed certificate is created by its owner but signed by a trusted Certificate Authority (CA). For setting up two-way SSL between Salesforce and an external system, two valid choices for digital certificates are:
Use a self-signed certificate for Salesforce and a self-signed certificate for the external system. This option is simple and cost-effective, but requires both parties to trust each other's self-signed certificates explicitly.
Use a self-signed certificate for Salesforce and a trusted CA-signed certificate for the external system.
This option is more secure and reliable, but requires Salesforce to trust the CA that signed the external system's certificate implicitly.

NEW QUESTION # 30
Universal Containers (UC) would like to enable self-registration for their Salesforce Partner Community Users. UC wants to capture some custom data elements from the partner user, and based on these data elements, wants to assign the appropriate Profile and Account values.
Which two actions should the Architect recommend to UC1
Choose 2 answers

- A. Modify the SelfRegistration trigger to assign Profile and Account.
- B. Configure Registration for Communities to use a custom Visualforce Page.
- C. Modify the CommunitiesSelfRegController to assign the Profile and Account.
- D. Configure Registration for Communitiesto use a custom Apex Controller.

Answer: C,D

Explanation:

To enable self-registration for partner community users, UC should modify the CommunitiesSelfRegController class to assign the Profile and Account values based on the custom data elements captured from the partner user. UC should also configure Registration for Communities to use a custom Apex controller that extends the CommunitiesSelfRegController class and overrides the default registration logic3.
