CompTIA A+ Core 1 Exam (2026) Sample Questions (Q310-Q315):

NEW QUESTION # 310

Which of the following connectors can be used to charge most modern mobile devices and may have the capacity to send data audio and video?

- A. MicroUSB
- B. MiniUSB
- C. Lightning
- **D. USB-C**

Answer: D

Explanation:

B:USB-C:

USB-C is a versatile connector that supports charging, high-speed data transfer, and the ability to send audio and video signals (e.g., DisplayPort over USB-C).

It is used by most modern mobile devices and laptops because of its fast transfer speeds and power delivery capabilities.

Incorrect Options:

A: Lightning: Lightning is proprietary to Apple devices and does not natively support video output.

C: MicroUSB: MicroUSB is outdated and does not support video output.

D: MiniUSB: MiniUSB is an older standard and does not support modern features like video output or fast charging.

Key Takeaway: USB-C is the most versatile connector for charging and transferring data, audio, and video.

NEW QUESTION # 311

A technician must install additional RAM in a desktop computer. Which of the following types of RAM will the technician most likely use?

- A. ECC
- **B. DIMM**
- C. Static
- D. Registered

Answer: B

Explanation:

Desktop computers most commonly use DIMM modules (Dual Inline Memory Module) for system memory.

DIMMs are the standard full-size RAM sticks installed in desktop motherboard memory slots and are available in modern DDR generations such as DDR4 and DDR5. CompTIA A+ Core 1 expects you to distinguish common form factors: desktops use DIMM, while laptops typically use SO-DIMM (Small Outline DIMM).

The other options are either specialized memory types or not the typical "type" used to describe desktop installation. Static refers to SRAM (static RAM), which is used for CPU cache and other internal high-speed buffers, not for installing system RAM modules in a desktop. ECC (Error-Correcting Code) memory is used mainly in servers/workstations where data integrity is critical and requires motherboard/CPU support; it is not the most likely choice for a typical desktop upgrade. Registered (buffered) memory is also primarily for servers and compatible platforms, improving stability with large memory configurations but not common in standard desktops. Therefore, the best answer for typical desktop RAM installation is DIMM.

NEW QUESTION # 312

A user is reporting that a computer has been very slow in recent days. The technician looks into the problem and finds pop-ups are randomly appearing on the screen. Which of the following is the next step the technician must take?

- A. Establish a new theory and consider escalating.
- B. Establish a knowledge base.

- C. Establish a theory of probable cause.
- D. Establish a plan of action.

Answer: C

Explanation:

The technician has identified the symptoms (slow performance and random pop-ups) and must now establish a theory of probable cause, such as malware or spyware infection.

NEW QUESTION # 313

Which of the following will most likely be an issue when increasing the channel width of an 802.11 network?

- A. Reduced collisions
- B. Increased latency
- C. Decreased data throughput
- D. Wireless interference

Answer: D

Explanation:

Increasing the channel width causes the wireless signal to occupy more spectrum, which raises the likelihood of overlapping with neighboring channels and results in greater wireless interference.

NEW QUESTION # 314

A company uses vital legacy software that does not run in the current OS version Which of the following will best support the software while keeping the OS current?

- A. Shared resources
- B. System sandbox
- C. Test development
- D. Application visualization

Answer: D

Explanation:

Application virtualization allows legacy software to run in a virtualized environment while the operating system remains current. It isolates the application from the OS, ensuring compatibility without downgrading the OS.

Why Not A (Shared resources): This relates to resource sharing, not application compatibility.

Why Not B (System sandbox): Sandboxes isolate applications for security testing, not compatibility.

Why Not C (Test development): Test environments are used for development, not running legacy applications.
