CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q346-Q351):

NEW QUESTION # 346
* Vault encryption using a variable block and key size
* Resistance to brute-force attacks
Which of the following should be implemented to meet these requirements? (Select two.)

- A. AES
- B. PBKDF2
- C. ECDSA
- D. P256
- E. RC5
- F. RIPEMD

Answer: A,B

Explanation:
Comprehensive and Detailed Step by Step Explanation:
* PBKDF2 (Password-Based Key Derivation Function 2) strengthens passwords against brute-force attacks.
* AES (Advanced Encryption Standard) supports variable block and key sizes, making it ideal for secure encryption.
* RC5, P256, and ECDSA are not relevant to password vault requirements.
* RIPEMD is a hashing algorithm and does not meet the criteria for encryption or brute-force resistance.

NEW QUESTION # 347
A company has been the target of LDAP injections, as well as brute-force, whaling, and spear-phishing attacks. The company is concerned about ensuring continued system access. The company has already implemented a SSO system with strong passwords. Which of the following additional controls should the company deploy?

- A. Identity proofing
- B. Live identity verification
- C. Two-factor authentication
- D. Challenge questions

Answer: C

Explanation:
While the company has implemented Single Sign-On (SSO) with strong passwords, additional security controls are required to mitigate attacks such as LDAP injections, brute-force, whaling, and spear-phishing. Two-factor authentication (2FA) provides an additional layer of security by requiring users to provide two different forms of authentication (e.g., a password and a security token or a biometric factor), reducing the likelihood of unauthorized access even if passwords are compromised. CASP+ emphasizes the importance of using multi-factor authentication mechanisms to strengthen access control and protect against such attacks.

NEW QUESTION # 348
During a recent breach, an attacker was able to get a user's login credentials by cracking a password that was retrieved via a stolen laptop. The attacker accessed the hashed passwords from the hard drive when it was connected to another device. Which of the following security measures could have helped prevent this account from being compromised?

- **A. Full Disk Encryption**
- B. Endpoint Detection and Response
- C. Host-based Firewall
- D. Host-based Intrusion Detection System

Answer: A

Explanation:
Full Disk Encryption ensures that the data on the laptop is encrypted at rest, preventing unauthorized access even if the device is stolen and its hard drive accessed externally. This aligns with CASP+ objective 3.5, which emphasizes implementing encryption to protect sensitive data against theft and compromise.

NEW QUESTION # 349
An application security engineer is performing a vulnerability assessment against a new web application that uses SAML. The engineer wants to identify potential authentication issues within the application. Which of the following methods would be most appropriate for the engineer to perform?

- A. Fuzz testing
- B. Side-channel analysis
- **C. Dynamic analysis**
- D. Static analysis

Answer: C

Explanation:
In this case, the security engineer is assessing a web application that uses SAML, and dynamic analysis (also known as DAST - Dynamic Application Security Testing) is the most appropriate method to identify potential authentication issues. Dynamic analysis tests the application in a runtime environment, allowing the engineer to identify vulnerabilities that arise during actual application execution, such as SAML misconfigurations or other authentication weaknesses. This is more effective for finding authentication issues compared to static analysis, which only reviews code without execution. CASP+ highlights the importance of dynamic testing in identifying real-world vulnerabilities, especially in web applications.

NEW QUESTION # 350
After establishing coding standards and integrating software assurance tools into CI/CD pipelines, an architect continues to find too many different coding styles throughout the team. Which of the following additional measures can the architect take to help improve consistency?

- **A. Create and proliferate framework code.**
- B. Require two-person integrity for code commits.
- C. Establish a chain of custody to govern code quality.
- D. Enhance the monitoring of code coverage for unit testing.

Answer: A

Explanation:
Framework code provides a standardized structure and set of conventions that all team members can follow, ensuring consistency in coding styles across the development team.
Option A (Chain of custody): This relates to tracking and managing code changes for accountability, not standardizing coding styles.
Option C (Two-person integrity): Ensures review and approval for code changes but does not enforce uniform coding styles.
Option D (Code coverage for unit testing): Focuses on test quality rather than addressing inconsistent coding styles.
