

# Latest Test FlashArray-Implementation-Specialist Discount - FlashArray-Implementation-Specialist Exam Engine

P.S. Free & New FlashArray-Implementation-Specialist dumps are available on Google Drive shared by PassLeaderVCE: <https://drive.google.com/open?id=1JqOpzuDm5ifxk-81mFSFrjijGLZTOctkS>

PassLeaderVCE offers the FlashArray-Implementation-Specialist exam questions in a convenient PDF format, allowing you to easily download them on your PC, laptop, Mac, tablet, or smartphone. With this accessibility, you can access the Pure Storage FlashArray-Implementation-Specialist PDF questions anytime and from anywhere. Having all the information about the Pure Storage Certified FlashArray Implementation Specialist (FlashArray-Implementation-Specialist) Exam at your fingertips enhances your studying experience, making it easier and more effective, whether you're at home or on the go.

## Pure Storage FlashArray-Implementation-Specialist Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Installation: This section of the exam measures the skills of Enterprise Infrastructure Technicians and focuses on executing a successful installation of FlashArray systems. It tests the ability to perform physical setup, cabling, configuration of network settings, and the application of initial system configurations necessary for full deployment.</li></ul>

Topic 2	<ul style="list-style-type: none"> <li>• Post-Installation</li> <li>• Upgrade: This section of the exam measures the skills of FlashArray Implementation Specialists and evaluates how professionals confirm system functionality after installation or an upgrade. It involves validating connectivity, running health checks, confirming configurations, and ensuring that the deployment meets operational expectations.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>• Pre-Installation</li> <li>• Upgrade: This section of the exam measures the skills of Enterprise Infrastructure Technicians and covers all preparation activities before deploying or upgrading a Pure Storage FlashArray. It includes understanding environmental requirements, verifying prerequisites, checking compatibility, and validating system readiness through appropriate tools and documentation.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• Upgrades: This section of the exam measures the skills of FlashArray Implementation Specialists and focuses on tasks involved in managing firmware and software upgrades. Candidates must demonstrate knowledge of upgrade planning, verification steps, and rollback procedures, ensuring that systems are updated with minimal disruption to service.</li> </ul>

## Pure Storage FlashArray-Implementation-Specialist Exam Engine - Test FlashArray-Implementation-Specialist Cram Pdf

PassLeaderVCE FlashArray-Implementation-Specialist study material also has a timekeeping function that allows you to be cautious and keep your own speed while you are practicing, so as to avoid the situation that you can't finish all the questions during the exam. With Pure Storage Certified FlashArray Implementation Specialist FlashArray-Implementation-Specialist Learning Materials, you only need to spend half your money to get several times better service than others.

### Pure Storage Certified FlashArray Implementation Specialist Sample Questions (Q138-Q143):

#### NEW QUESTION # 138

During a hardware NDU from a FlashArray//X20R3 to an X20R4-LL (low-line) model, the Implementation Engineer encounters a failure during the power supply check. Voltage readings are correct. What is a likely cause of this failure?

- A. Purity does NOT recognize the power supplies installed in the array.
- **B. There are more than 10 drives installed in the chassis.**
- C. The power cables are NOT fully seated in the array.

**Answer: B**

Explanation:

The FlashArray//X20R4-LL (Low-Line) model is a specific configuration designed for lower capacity and power entry points. Unlike the standard //X or //XL models which can support fully populated chassis and shelves, the "Low-Line" configurations often come with strict hardware limitations regarding power draw and drive count. A known constraint for specific Low-Line chassis upgrades, particularly when moving to the X20R4-LL, is a limitation on the number of DirectFlash Modules (drives) supported due to the power supply unit (PSU) capacity or thermal design targeted for that specific SKU.

In this scenario, if the source array (X20R3) was populated with more drives than the target X20R4-LL supports-specifically more than 10 drives-the upgrade validation checks (such as those performed by the upgrade script or Purity health checks) will flag a failure. Even though the voltage readings are technically correct (indicating the PDUs are providing power), the check fails because the hardware configuration exceeds the supported power budget for that specific chassis model.

Implementation Engineers must verify the drive count of the source array against the specifications of the target "Low-Line" array during the planning phase. If the source array has 11 or more drives, the target hardware cannot be an LL model; it would require a standard model to support the additional power load of the extra drives. This check prevents the array from booting into a state where it might experience power contention or thermal shutdown under load.

#### NEW QUESTION # 139

An Implementation Engineer is onsite to add two 4-port FC cards to a FlashArray//X20R3. In what state should the controller be in before performing the card add procedure?

- A. Secondary
- B. Primary
- C. Standby

**Answer: A**

Explanation:

Before performing a physical card addition (I/O expansion) on a specific controller, it should be in the Secondary state.

The procedure for adding hardware to a FlashArray is a sequential, non-disruptive process. You cannot add a card to the Primary controller because it is actively handling host I/O; opening it would cause a service outage. Therefore, the Implementation Engineer must first verify the cluster health and, if necessary, perform a manual failover (`pureadm make --secondary`) to ensure the target controller is Secondary.

Once the controller is Secondary (passing no I/O), the engineer proceeds to stop the Purity software (`pureadm stop`) and/or power down the controller to safely install the PCIe card. While the physical work happens when the controller is powered off/inactive, "Secondary" is the correct operational starting state required to begin the maintenance workflow safely. "Standby" is often used to refer to a controller that is powered on but not running Purity, which is a subsequent step, not the initial prerequisite state relative to the cluster role.

#### NEW QUESTION # 140

An Implementation Engineer has installed a data pack and the `list` command shows the drives in "unadmitted" status. Which command should the Implementation Engineer run to complete the admission?

- A. `puredrive add`
- B. `purearray drive admit`
- C. `puredrive`

**Answer: B**

Explanation:

When new capacity (a data pack) is physically installed into a FlashArray, the drives are detected by the system but are not automatically added to the storage pool to prevent accidental data overwrites or configuration errors. They appear in an "unadmitted" state.

To logically add these drives to the array's capacity, the Implementation Engineer must explicitly admit them.

The command to perform this action is `purearray drive admit` (or `puredrive admit` in some contexts, but `purearray drive admit` is the specific option provided and valid). This command triggers the Purity software to format the new drives, add them to the system's write groups, and begin rebalancing data across the expanded capacity. Without running this admission command, the drives will remain visible but unusable for storage.

---

#### NEW QUESTION # 141

An Implementation Engineer is performing a capacity consolidation on an X50R2 that is 83% full. The starting config is X50R2-20/10-22/0. The end config is X50R2-91/0. What steps should the Implementation Engineer follow to complete the work?

- A. Evac the chassis drives, install the new 91TB chassis data pack, and evac SH0.
- B. Evac SH0, evac the 20TB chassis DP, install the new 91TB DP, and evac the 10TB chassis DP.
- C. Move the 20TB chassis DP to SH0, install the new 91TB chassis DP, evac the 10TB chassis DP, and evac SH0.

**Answer: A**

Explanation:

The correct consolidation process involves evacuating data from the existing chassis drives first, then installing the new larger 91TB data pack, and finally evacuating shelf 0 to complete the consolidation efficiently.

#### NEW QUESTION # 142

What command will view NVRAM install and update status?

- A. purearray list
- B. purehw list --all
- C. puredrive list

**Answer: B**

Explanation:

The command purehw list --all displays detailed hardware information, including NVRAM installation and update status on the FlashArray.

## NEW QUESTION # 143

.....

If you ask how we can be so confident with our FlashArray-Implementation-Specialist exam software, we will tell you that first our PassLeaderVCE is an experienced IT software team; second we have more customers who have pass FlashArray-Implementation-Specialist exam with the help of our products. FlashArray-Implementation-Specialist Exam Certification is international recognized, and do you want this authority certificate? Then, you will easily get the certification with the help of our FlashArray-Implementation-Specialist exam software.
