## New JN0-664 Test Bootcamp & Latest JN0-664 Test Blueprint

Achieving the Service Provider, Professional (JNCIP-SP) (JN0-664) certification can significantly impact your career progression and earning potential. This certification showcases your expertise and knowledge to employers, making you a valuable asset in the Juniper JN0-664 industry. With the rapidly evolving nature of the Juniper world, staying up-to-date with the latest technologies and trends is crucial. The JN0-664 Certification Exam enables you to learn these changes and ensures you remain current in your field.

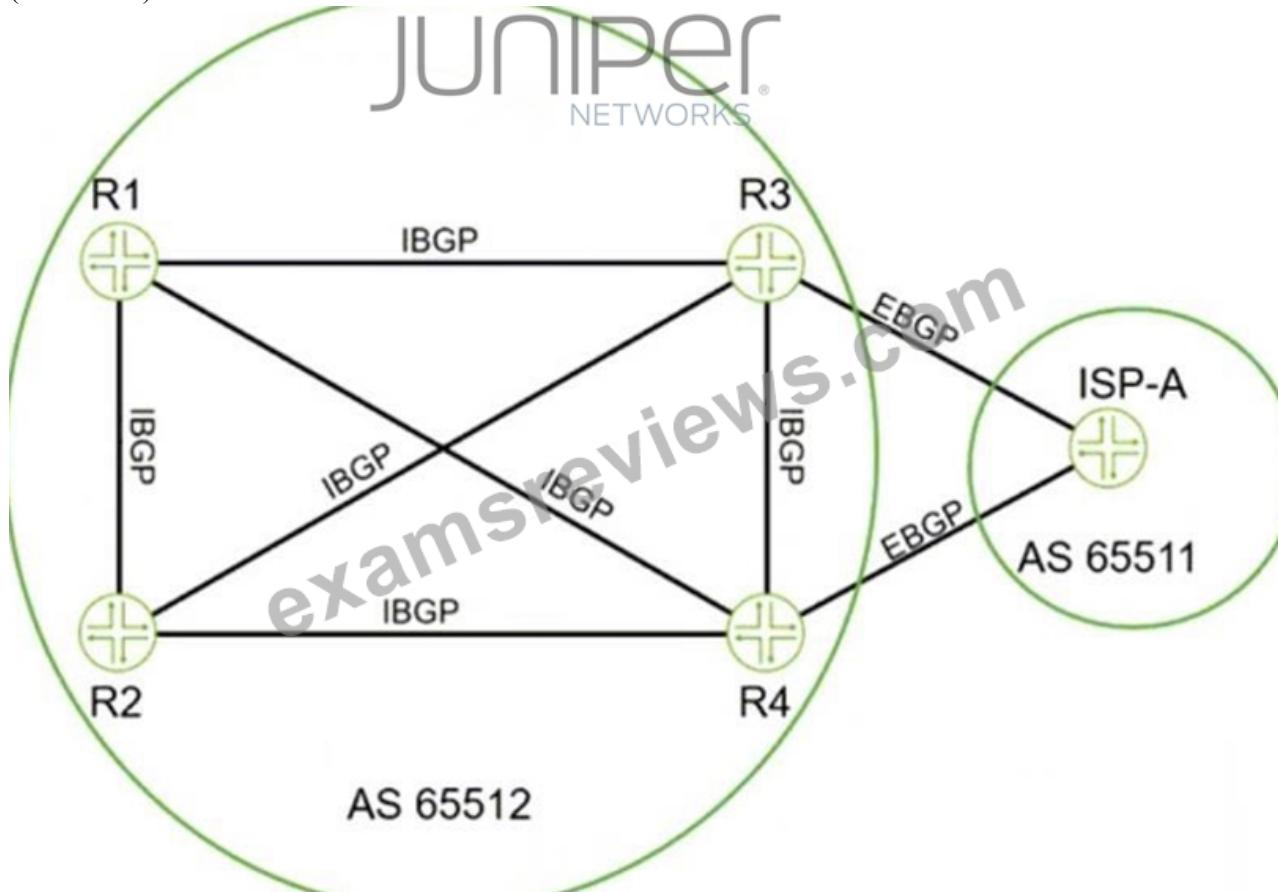

Juniper JN0-664 (Service Provider, Professional (JNCIP-SP)) Certification Exam is a comprehensive test of a candidate's knowledge, skills, and abilities in service provider routing and switching technologies. Service Provider, Professional (JNCIP-SP) certification is highly regarded in the industry and can greatly enhance an individual's career prospects in the networking field.

Juniper JN0-664 Exam is a valuable certification for professionals who want to work in the Service Provider field. It demonstrates their knowledge and expertise in Juniper Networks Service Provider Routing and Switching technologies. Service Provider, Professional (JNCIP-SP) certification can help professionals advance their careers and increase their earning potential.

## Juniper Service Provider, Professional (JNCIP-SP) Sample Questions (Q87-Q92):

### NEW QUESTION # 87

Referring to the exhibit, which two statements are correct about BGP routes on R3 that are learned from the ISP-A neighbor? (Choose two.)

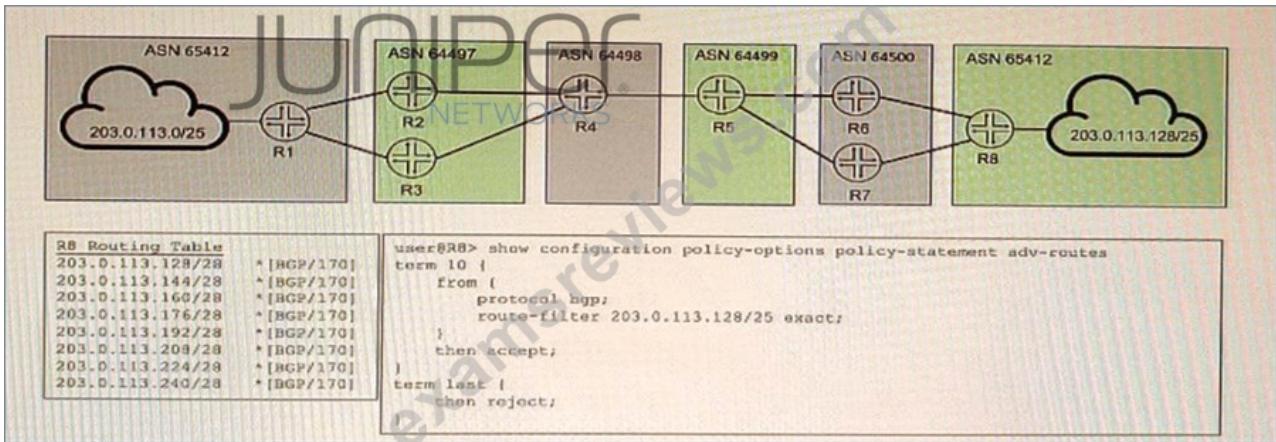

- A. The BGP local-preference value that is used by ISP-A is not advertised to R3.
- B. The next-hop value for these routes is changed by ISP-A before being sent to R3.
- C. All BGP attribute values must be removed before receiving the routes.
- D. By default, the next-hop value for these routes is not changed by ISP-A before being sent to R3.

Answer: A,D

### NEW QUESTION # 88

Exhibit

You are attempting to summarize routes from the 203.0.113.128/25 IP block on R8 to AS 64500. You implement the export policy shown in the exhibit and all routes from the routing table stop being advertised.

In this scenario, which two steps would you take to summarize the route in BGP? (Choose two.)

- A. Add the set protocols bgp family inet unicast add-path command to allow additional routes to the RIB tables. -
- B. Remove the from protocol bgp command from the export policy.
- C. Replace exact in the export policy with orlonger.
- D. Add the set routing-options static route 203.0.113.123/25 discard command.

**Answer: C,D**

**Explanation:**

To summarize routes from the 203.0.113.128/25 IP block on R8 to AS 64500, you need to do the following:

Add the set routing-options static route 203.0.113.128/25 discard command. This creates a static route for the summary prefix and discards any traffic destined to it. This is necessary because BGP can only advertise routes that are present in the routing table.

Replace exact in the export policy with orlonger. This allows R8 to match and advertise any route that is equal or more specific than the summary prefix. The exact term only matches routes that are exactly equal to the summary prefix, which is not present in the routing table.

### NEW QUESTION # 89

You are using a Layer 3 VPN to connect two customer sites. The VPN routes for the customer networks appear as hidden in the bgp.l3vpn.0 routing table on the PE routers.

What is causing this problem?

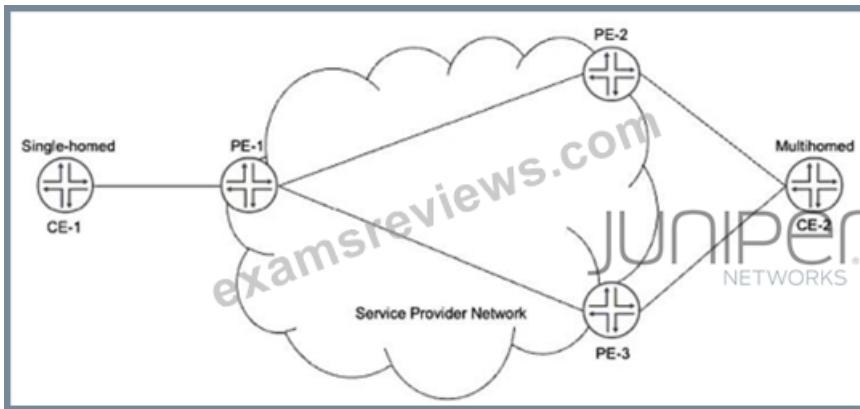

- A. There is a routing loop in the service provider backbone.
- B. The routes use overlapping IP addresses.
- C. Route targets are not configured.
- D. There is not an established MPLS LSP between the two PE routers.

**Answer: D**

### NEW QUESTION # 90

You have an EVI implemented between PE-1, PE-2, and PE-3 to allow communication between CE-1 and CE-2. CE-2 receives unicast traffic from CE-1 on both links to PE-2 and PE-3. When CE-1 sends broadcast traffic, CE-2 receives it on only one of the multihomed links.

Referring to the exhibit, which EVPN route type enables this behavior?

- A. Type 4
- B. Type 3
- C. Type 2
- D. Type 1

**Answer: A**

#### NEW QUESTION # 91

Which two statements are correct about VPLS tunnels? (Choose two.)

- A. LDP-signaled VPLS tunnels use auto-discovery to provision sites
- B. BGP-signaled VPLS tunnels can use either RSVP or LDP between the PE routers.
- C. LDP-signaled VPLS tunnels only support control bit 0.
- D. BGP-signaled VPLS tunnels require manual provisioning of sites.

**Answer: A,B**

Explanation:

Explanation

VPLS is a Layer 2 VPN technology that allows multiple sites to connect over a shared IP/MPLS network as if they were on the same LAN. VPLS tunnels can be signaled using either Label Distribution Protocol (LDP) or Border Gateway Protocol (BGP). LDP-signaled VPLS tunnels use auto-discovery to provision sites, meaning that PE routers can automatically discover other PE routers that belong to the same VPLS instance

#### NEW QUESTION # 92
