100% Pass Accurate Tableau - TDA-C01 - Tableau Certified Data Analyst Customized Lab Simulation

If you want to constantly improve yourself and realize your value, if you are not satisfied with your current state of work, if you still spend a lot of time studying and waiting for TDA-C01 qualification examination, then you need our TDA-C01 material, which can help solve all of the above problems. I can guarantee that our study materials will be your best choice. Our TDA-C01 Study Materials have three different versions, including the PDF version, the software version and the online version.

Tableau Certified Data Analyst Sample Questions (Q38-Q43):

NEW QUESTION # 38

You are the owner of an alert.

You receive an email notification that the alert was suspended

From where can you resume the suspended alert?

- A. The My Content area of Tableau web pages
- B. The Data Source page of Tableau Desktop
- C. The Shared with Me page
- D. The Notification area of Tableau Prep

Answer: A

Explanation:

To resume a suspended alert, you need to go to the My Content area of Tableau web pages, where you can see all the alerts that you own or subscribe to. You can click on the alert name and then select Resume from the menu. You can also edit or delete the alert from there. Reference: <https://help.tableau.com/current/pro/desktop/en-us/alerts.htm>

https://help.tableau.com/current/pro/desktop/en-us/alerts_manage.htm

NEW QUESTION # 39

You have the following dashboard.

Currently the map is used as a filter that affects the data on the other sheets of the dashboard. You need to configure the dashboard to ensure that selecting a data point on the map only filters the Detail table. What should you do?

- A. From the context menu of Sales over time select Ignore Actions
- B. From the context menu of Profits by State deselect Use as Filter
- C. From the context menu of Sales over time select Deselect
- D. From the context menu of Sales over time select Remove Dashboard Item

Answer: A

NEW QUESTION # 40

You create a parameter named Choose Region that contains values from a field named Region.

You want users to be able to use the Choose Region parameter to interact with a chart by toggling between different regions. What should you do next?

- A. Add the Choose Region parameter to the Pages card
- B. Set the Choose Region parameter to Single Value (list)
- C. Add Region to the Filters card
- D. Add the [Region] = [Choose Region] formula to the Filters card

Answer: C

Explanation:

To use the Choose Region parameter to interact with a chart by toggling between different regions, you should add the [Region] = [Choose Region] formula to the Filters card. This formula will create a boolean filter that returns TRUE if the value in the Region field matches the value in the Choose Region parameter, and FALSE otherwise. You can add this formula to the Filters card by right-clicking on it and selecting Add Filter from the menu. Then you can select Condition from the dialog box and enter the formula in the text box. This will filter the chart to show only the data for the selected region.

The other options are not correct for this scenario. Adding Region to the Filters card will create a categorical filter that shows a list of values from the Region field, but it will not use the Choose Region parameter. Adding the Choose Region parameter to the Pages card will create a page control that allows you to cycle through different values of the parameter, but it will not filter the chart. Setting the Choose Region parameter to Single Value (list) will change how the parameter control appears on the worksheet, but it will not

affect how it interacts with the chart. Reference: <https://help.tableau.com/current/pro/desktop/en-us/parameters.htm>
<https://help.tableau.com/current/pro/desktop/en-us/filtering.htm> https://help.tableau.com/current/pro/desktop/en-us/filtering_condition.htm

NEW QUESTION # 41

You have the following dataset that contain null values in the Profits field.

- You want the data to appear as shown in the following table.
- Which two formulas achieve the goal? Choose two.

- A. 2N ([Profits])
- B. IFNULL ([profits] ,0)
- C. IFNULL([Profits],0) D. IF [Profits] != null then [Profits] END
- D. IF [Profits] != null then [Profits] END
- E. ISNULL ([Profits])

Answer: A,B

Explanation:

The IFNULL function is a logical function that returns the first argument if it is not null, and the second argument if it is null. In this case, the first argument is [Profits], which is the field that contains null values. The second argument is 0, which is the value that you want to replace null values with. The function will return [Profits] if it is not null, and 0 if it is null.

The IF statement is a logical statement that returns a value or performs an action if a condition is true, and optionally returns another value or performs another action if the condition is false. In this case, the condition is [Profits] != null, which means that [Profits] is not null. The statement will return [Profits] if the condition is true, and nothing if the condition is false. The END keyword marks the end of the statement.

The other options are not correct for this scenario. The ZN function is a logical function that returns zero if a value or expression is null, and returns the value or expression itself if it is not null. However, it only works with numeric values or expressions, and [Profits] may not be numeric in this case. The ISNULL function is a logical function that returns TRUE if a value or expression is null, and FALSE otherwise. It does not replace null values with another value. Reference: https://help.tableau.com/current/pro/desktop/en-us/functions_functions_logical.htm#IFNULL https://help.tableau.com/current/pro/desktop/en-us/functions_functions_logical.htm#IF https://help.tableau.com/current/pro/desktop/en-us/functions_functions_logical.htm#ZN https://help.tableau.com/current/pro/desktop/en-us/functions_functions_logical.htm#ISNULL Explanation:

The two formulas that will make the data appear as shown in the second table are:

NEW QUESTION # 42

You connect to a database server by using Tableau Prep. The database server has a data role named Role1.

You have the following field in the data.

- You need to apply the Role1 data role to the Material field.
- Which two actions should you perform? Choose two.

- A. For the data type of the Material field, select Custom, and then select Role1.
- B. From the More actions menu of Materials, select Group Values, and then select Spelling.
- C. From the More actions menu of Materials, filter the selected values.
- D. From the More actions menu of Materials, select Valid in the Show values section.

Answer: A,B

Explanation:

To apply a custom data role to a field, you need to select the data type of the field and then choose the data role from the list of available roles. This will validate the values in the field against the data role and mark any invalid values with a red exclamation mark. To fix the invalid values, you can use the Group Values option and select the Spelling algorithm, which will group values that are close in spelling and replace them with the most frequent value in the group. This will help you standardize the values in the Material field and match them with the Role1 data role. References: The information is based on the following sources:

Use Data Roles to Validate your Data - Tableau
