

Latest 2V0-15.25 Exam Duration & 2V0-15.25 Valid Dumps Sheet

Complete 2V0-15.25 Exam Guide with Practice Tests

Prepare - <https://bit.ly/4csa0RE> - confidently for the 2V0-15.25 exam with this comprehensive practice test and study guide, designed to cover all key concepts of VMware Cloud Foundation 9.0 Support. Featuring realistic practice questions that mirror the actual exam format, it helps you identify knowledge gaps and strengthen your understanding with clear, detailed explanations. Whether you're beginning your preparation or refining your skills, this resource offers a structured approach to mastering exam topics, boosting your confidence, and increasing your chances of certification success.

2026 Latest PracticeMaterial 2V0-15.25 PDF Dumps and 2V0-15.25 Exam Engine Free Share: <https://drive.google.com/open?id=1trtVmxBgtJQaGYXyT1IGzgKYfNSc14Xw>

The VMware 2V0-15.25 exam offers a great opportunity for beginner and experienced to validate their expertise in a short time period. To do this they just need to pass the VMware Cloud Foundation 9.0 Support 2V0-15.25 Certification Exam which is not an easy task. And PracticeMaterial offers latest 2V0-15.25 exam practice, exam pattern and practice exam online.

VMware 2V0-15.25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Troubleshoot and Optimize the VMware by Broadcom Solution: This domain focuses on troubleshooting VCF deployment, upgrades, conversions, workload domains, fleet operations (certificates, passwords, identity), licensing, compute resources, storage (vSAN, supplemental storage), networking (VDS, NSX), VCF Operations tools, Identity Broker automation, and HCX workload migrations.
Topic 2	<ul style="list-style-type: none">• Plan and Design the VMware by Broadcom Solution: This domain addresses architectural planning and design principles for creating scalable, secure virtual environments aligned with business requirements.
Topic 3	<ul style="list-style-type: none">• VMware by Broadcom Solution: This section focuses on understanding VMware by Broadcom's virtualization and cloud infrastructure platform for managing modern enterprise workloads.

Topic 4	<ul style="list-style-type: none"> IT Architectures, Technologies, Standards: This domain covers fundamental frameworks, tools, and best practices for building scalable, secure, and interoperable enterprise IT systems.
Topic 5	<ul style="list-style-type: none"> Install, Configure, Administrate the VMware by Broadcom Solution: This area covers installing, configuring, and managing VMware solutions including VCF Fleet deployment, expansion, and reduction operations.

VMware 2V0-15.25 Valid Dumps Sheet, 2V0-15.25 Test Answers

Our 2V0-15.25 practice dumps is high quality product revised by hundreds of experts according to the changes in the syllabus and the latest developments in theory and practice, it is focused and well-targeted, so that each student can complete the learning of important content in the shortest time. With 2V0-15.25 training prep, you only need to spend 20 to 30 hours of practice before you take the 2V0-15.25 exam.

VMware Cloud Foundation 9.0 Support Sample Questions (Q24-Q29):

NEW QUESTION # 24

An administrator discovers that a VMware Cloud Foundation (VCF) workload domain four-node vSAN cluster is experiencing a network partition. The workload domain vCenter displays a "vSAN duster partition" warning. The performance across the cluster is degraded and the objects are showing as non-compliant.

What could be causing the network partition?

- A. IGMP snooping is disabled on the multicast group.
- B. Jumbo frames are configured on the vSphere distributed switch (VDS).
- C. The vSAN Witness service was added to the vMotion network.
- D. The VLAN was changed on the physical switch port.

Answer: D

Explanation:

AvSAN cluster network partition occurs when vSAN nodes cannot communicate over the designated vSAN network. In VMware Cloud Foundation workload domains, the vSAN network relies on L2 adjacency, consistent VLAN configuration, and stable multicast/BUM behavior (in older versions). VCF 9.0 uses unicast-mode vSAN, so multicast-related issues (such as IGMP snooping configuration) are no longer relevant.

A network partition can occur when the VLAN ID on the physical switch port differs from the VLAN configured on the vSphere Distributed Switch (VDS) for the vSAN VMkernel adapters. The documentation emphasizes that consistent VLAN configuration across the physical and virtual networks is required for proper vSAN cluster communication. If a switch port is reconfigured-intentionally or accidentally-to use a different VLAN, the node becomes isolated from the rest of the vSAN cluster, causing:

* "vSAN cluster partition" warnings in vCenter

* degraded performance

* objects marked as non-compliant

* resyncs that cannot complete

Option A (IGMP snooping) does not apply because modern vSAN uses unicast, not multicast.

Option C (Jumbo frames) would cause packet loss only if inconsistently configured, but it does not cause a full network partition.

Option D (vSAN Witness on vMotion) is relevant only for stretched clusters and does not cause a partition in a standard four-node cluster.

NEW QUESTION # 25

An administrator is tasked with replacing a VMware vCenter certificate in VMware Cloud Foundation (VCF) Operations with an external CA-signed certificate. The certificate import completes successfully but when running the certificate replacement task, it fails with the following error: Certificate replacement has failed...

The Certificate Chain validation failed due to 'Signature does not match' What is the possible cause of this issue?

- A. The external CA is not accessible to VCF Operations.
- **B. The server certificate was copied to the wrong field.**
- C. The Certificate Signing Request (CSR) included the IP address of the vCenter.
- D. The external CA is not trusted by VCF Operations.

Answer: B

Explanation:

When replacing certificates in VMware Cloud Foundation (VCF) Operations, the system performs strict certificate chain validation.

The error shown:

"Certificate chain validation failed due to 'Signature does not match'" indicates that VCF Operations attempted to validate the presented certificate chain but detected that the server certificate did not correctly match the signing CA certificate. This occurs most commonly when the administrator pastes the server certificate and CA root/intermediate certificates into the wrong fields during import.

VCF requires the certificate bundle to be uploaded in the correct format:

- * Server certificate# Server Certificate field
- * Intermediate certificates# Intermediate Chain field
- * Root certificate# Root CA field

If the chain order is wrong or the server certificate is mistakenly placed in an intermediate or root CA field, the cryptographic signature validation fails. This exact failure mode is documented in VMware certificate replacement workflows.

Option A is incorrect because including an IP address in a CSR does not invalidate chain signatures.

Option B is incorrect because an untrusted CA produces a trust failure, not a signature mismatch.

Option C is unrelated: accessibility is not required for certificate validation.

NEW QUESTION # 26

Through the VMware NSX Manager user interface, the administrator has identified an issue with BGP peering. Which command on the NSX Edge Transport Node provides more information about the issue?

- **A. get log-file routing follow**
- B. get edge-cluster status
- C. get edge-cluster history state
- D. get logical-routers

Answer: A

Explanation:

When troubleshooting BGP peering issues on an NSX Edge Transport Node, VMware documentation directs administrators to examine routing logs, because BGP failures are often caused by adjacency negotiation errors, authentication mismatches, keepalive/hold timer issues, or route-policy failures.

The NSX Edge CLI command:

get log-file routing follow

streams real-time routing logs, including BGP daemon logs (bfd, routed, wdog) and provides detailed insight into:

- * BGP session establishment and teardown
- * Keepalive and hold timer exchanges
- * Neighbor state transitions
- * Route advertisement or rejection
- * Authentication mismatches
- * MTU or connectivity issues on TEP / uplinks

This is the only command in the list that exposes diagnostic-level BGP information needed to troubleshoot peering.

Option A (edge-cluster status) shows cluster membership only.

Option B (get logical-routers) shows logical router configuration, not BGP logs.

Option C (edge-cluster history state) is unrelated to routing.

NEW QUESTION # 27

A user attempts to deploy a catalog item into a vSphere Namespace in a VMware Cloud Foundation (VCF) Automation Organization for All Apps. The catalog item will not deploy into zone3.

The following information is provided:

- * The vSphere Supervisor has three zones (zone1, zone2, zone3).
- * The user has successfully deployed the catalog item into zone1 and zone2 of the vSphere Namespace.

What is the cause of this issue?

- A. The vSphere Namespace is assigned the default large vSphere Namespace Class.
- B. The user does not have Project Advanced User role for the vSphere Namespace.
- **C. The vSphere Namespace does not include zone3.**
- D. The user does not have the Project User role for the vSphere Namespace.

Answer: C

Explanation:

In VMware Cloud Foundation (VCF) Automation for All Apps, a vSphere Namespace can span multiple Supervisor Zones. However, workloads—including catalog item deployments—can only be deployed into zones that are explicitly assigned to that Namespace. The user in the scenario successfully deploys into zone1 and zone2, which confirms that those zones are correctly associated with the Namespace.

The failure to deploy into zone3, while deployments into the other zones work, strongly indicates that zone3 is not part of the Namespace configuration.

This behavior matches how Supervisor Zones function:

* A zone must be added to the Namespace in Supervisor configuration.

* If the zone is not associated, VCF Automation will not present it as an eligible deployment location, and deployment into that zone fails.

Option A and D (project roles) are incorrect because insufficient permissions would prevent deployment into any zone, not a single missing zone.

Option B (Namespace Class) is irrelevant because Namespace Classes define resource limits, not which Supervisor Zones the Namespace is mapped to.

NEW QUESTION # 28

An administrator has successfully mounted an NFS datastore as supplemental storage for a VMware Cloud Foundation (VCF) workload domain cluster. However, users report that data cannot be written to the datastore.

The administrator confirms the following:

* The NFS share is visible in the vSphere Client.

* Connectivity to the NFS server from the Virtual Machine.

What action should the administrator take next to troubleshoot the issue?

- A. Verify the MTU size configuration on the NFS VMkernel port group.
- B. Reboot the ESX host to clear any file locks.
- C. Verify the NFS server is listed in the VMware Hardware Compatibility Guide.
- **D. Verify that the NFS server permissions are not set to read-only for the ESX host.**

Answer: D

Explanation:

In VMware Cloud Foundation 9.0, supplemental storage such as NFS is fully supported for workload domains when configured correctly. When an NFS datastore mounts successfully in vSphere but users cannot write data, the issue almost always lies in the export permissions on the NFS server. vSphere will allow mounting a read-only NFS export, but write operations will fail silently at the VM or guest OS level.

VCF documentation confirms that ESXi requires explicit read/write export permissions, typically configured per-host or by IP subnet, on the NFS server. Even if network connectivity and VM-level access appear healthy, incorrect server-side permissions prevent ESXi from executing write operations.

Option A is incorrect because NFS servers are not validated by the HCL for write capability.

Option B (rebooting the host) is unnecessary and unrelated to permission enforcement.

Option D (MTU mismatch) may cause performance issues, not write-access failures.

Thus, the next troubleshooting step is to verify that the ESXi hosts have read/write access on the NFS share, making C the correct answer.

NEW QUESTION # 29

.....

VMware certification can improve companies' competition, enlarge companies' business products line and boost IT staff constant learning. Many companies may choose 2V0-15.25 valid exam study guide for staff while they are urgent to need one engineer with a

useful certification so that they can get orders from this VMware or get the management agency right. Our 2V0-15.25 valid exam study guide will be the best valid choice for them.
