Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q48-Q53):

NEW QUESTION # 48

Which two actions are typically performed in ROMMON mode during the password recovery process? (Choose two.)

- A. Load the startup configuration.
- B. Modify passwords.
- C. Change the configuration register.
- D. Save the configuration.
- E. Reboot the device.

Answer: C,E

Explanation:

During the password recovery process on Cisco devices, ROMMON (ROM Monitor) mode is utilized to perform specific actions that facilitate the recovery. Two critical actions typically performed in ROMMON mode are:

* Change the Configuration Register: The configuration register is modified to instruct the device to ignore the startup configuration during the next boot. This is commonly achieved by setting the configuration register to 0x2142. This action prevents the device from loading the saved configuration, allowing access without requiring the existing passwords.

* Reboot the Device: After changing the configuration register, the device is rebooted to apply the new settings. This reboot enables the device to bypass the startup configuration, facilitating the password recovery process.

These steps are essential in the password recovery procedure, allowing administrators to regain access to the device without erasing the existing configuration.

NEW QUESTION # 49

Which term describes the physical range of radio frequency coverage provided by an access point in a wireless topology?

- A. Service Set Identifier (SSID)
- B. Basic Service Area (BSA)
- C. Wireless LAN (WLAN)
- D. Wireless LAN Controller (WLC)

Answer: B

Explanation:

In wireless networking, the Basic Service Area (BSA) refers to the physical area of radio frequency coverage provided by an access point (AP) in a Basic Service Set (BSS). The BSA defines the coverage area where wireless clients can connect to the network through the AP. The size and shape of a BSA depend on various factors, including the AP's transmit power, antenna type, and physical environment.

Option A, the Service Set Identifier (SSID), is the network name broadcast by the AP. Option C, Wireless LAN (WLAN), refers to the overall wireless network. Option D, Wireless LAN Controller (WLC), is a device that manages multiple APs in a network. Reference: Supporting Cisco Devices for Field Technicians (FLDTEC) - Wireless Device Support

NEW QUESTION # 50

Refer to the exhibit. Drag and drop the functions from the left onto the corresponding devices on the right.

provides 4K resolution and zoom capabilities	Cisco Room Navigator
supports video conferencing and content sharing	Cisco PTZ 4K Camera

- * Cisco Room Navigator: A touchscreen device that provides intuitive control for room settings, scheduling, and call management.

NEW QUESTION # 51

Which two network design strategies in Cisco data center solutions improve fault tolerance and high availability? (Choose two.)

- A. Virtual port channels for link aggregation
- B. Redundant supervisor engines and fabric modules
- C. High-density 10/40/100 gigabit Ethernet connectivity
- D. SAN extension over IP networks (FCIP)
- E. Access layer switch deployment

Answer: A,B

Explanation:

To ensure high availability and fault tolerance in Cisco data center designs, two effective strategies include:

- * Redundant Supervisor Engines and Fabric Modules: These provide failover capabilities, so if one supervisor or fabric module fails, another can take over, maintaining network operations without interruption.
- * Virtual Port Channels (vPCs): vPCs allow connections to be made to two physical switches while appearing as one logical switch.

This prevents loops and adds redundancy and load balancing, which is critical in high-availability environments. Other options may enhance performance (e.g., high-density Ethernet) or extend functionality (e.g., FCIP), but do not directly contribute to fault tolerance and high availability in the same way.

NEW QUESTION # 52

- A. It provides a dedicated uplink to the Meraki cloud for management.
- B. It connects to the Stack Port 2 of the previous switch in a stack configuration.
- C. It serves as a high-speed interconnect for clustered switches.
- D. It connects to the Stack Port 2 of the next switch in a stack configuration.
