Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q23-Q28):

NEW QUESTION # 23

Refer to the exhibit. Drag and drop the functions from the left onto the corresponding internal memory components on the right.

bootstrap code, post code, ROM monitor	NVRAM
startup configuration	RAM
running configuration	ROM
Cisco IOS software, backup configuration	flash memory

Answer:

Explanation:

Explanation:

NVRAM # Startup configuration

RAM # Running configuration

ROM # Bootstrap code, POST code, ROM monitor

Flash memory # Cisco IOS software, backup configuration

Each memory type in a Cisco device serves a specific function in the boot process and runtime operation.

NVRAM retains configuration across reboots, RAM is volatile and holds active configs, ROM handles initial boot tasks, and flash stores the operating system.

This content is covered thoroughly in "Cisco Equipment and Related Hardware" in the FLDTEC curriculum. Here's the breakdown:

ROM (Read-Only Memory)

- * Stores bootstrap code, POST (Power-On Self-Test), and ROM Monitor.
- * These are essential for the device's initial power-on operations and recovery modes.

NVRAM (Non-Volatile RAM)

- * Holds the startup configuration file, which is loaded during the boot process.
- * Content remains intact after a reboot or power cycle.

RAM (Random Access Memory)

- * Stores the running configuration and current operational state of the router or switch.
- * Also used for routing tables, ARP cache, and packet buffers.
- * Data is lost when the device is powered off or rebooted.

Flash Memory

- * Contains the Cisco IOS image, system files, and can store backup configurations.
- * It is a non-volatile storage, so it retains data after reboots.

NEW QUESTION # 24

Drag and drop the tools from the left onto the corresponding primary functions on the right.

Answer:

Explanation:

Explanation:

In the FLDTEC curriculum, technicians are trained on physical tools essential for support in the field. These tools and their uses are explained as follows:

* Flash Card Reader: Used with removable CompactFlash cards commonly found in older Cisco routers and switches. These cards hold the IOS image or config files.

* USB Thumb Drive: Used for transferring IOS files or configs directly to and from Cisco devices that support USB storage. Convenient for portable backups.

* RJ-45 Ethernet Loopback Connector: A diagnostic tool that loops the signal back into the port. Helps verify port functionality by simulating a live Ethernet connection.

* RJ-45 Coupler: Allows two patch cables to be connected, effectively extending the reach of a cable - useful in setups where a

single cable is not long enough.

NEW QUESTION # 25

How many bits are borrowed from the default host portion of the address to create subnets in a Class B network with a subnet mask 255.255.255.0?

- A. 3 bits
- B. 3 bits
- C. 8 bits
- D. 5 bits

Answer: C

Explanation:

In a Class B network, the default subnet mask is 255.255.0.0, which allocates:

* 16 bits for the network portion

* 16 bits for the host portion

When the subnet mask is changed to 255.255.255.0, it becomes:

* 24 bits for the network portion

* 8 bits for the host portion

This indicates that 8 bits have been borrowed from the host portion to create additional subnets. Borrowing bits allows for the division of the original network into smaller sub-networks, enhancing organization and security within the network.

NEW QUESTION # 26

Which management option is best suited for standalone Cisco Secure Firewall deployments?

- A. Cisco Secure Firewall Management Center
- B. Cisco Defense Orchestrator
- C. Cisco Secure Firewall Device Manager
- D. Cisco Security Manager

Answer: C

Explanation:

For standalone Cisco Secure Firewall deployments, the Cisco Secure Firewall Device Manager (FDM) is the most appropriate management option. FDM is a browser-based, on-box management tool that allows administrators to configure and manage a single firewall device without the need for external management infrastructure. It provides an intuitive interface for basic configurations, policy management, and monitoring.

In contrast:

* Cisco Secure Firewall Management Center (FMC) is designed for centralized management of multiple firewall devices.

* Cisco Defense Orchestrator (CDO) is a cloud-based solution for managing security policies across various devices.

* Cisco Security Manager is an older platform primarily used for managing ASA devices.

NEW QUESTION # 27

Which layer of the OSI model provides error detection and defines how access to the media is controlled?

- A. Physical layer
- B. Data link layer
- C. Presentation layer
- D. Network layer

Answer: B

Explanation:

The Data Link Layer (Layer 2) of the OSI model is responsible for node-to-node data transfer and plays a crucial role in error detection and media access control. It ensures that data frames are transmitted to the correct device on a local network segment.

This layer is divided into two sublayers:

* Logical Link Control (LLC):Manages frame synchronization, flow control, and error checking.

* Media Access Control (MAC):Controls how devices on the network gain access to the medium and permission to transmit data.

Together, these sublayers ensure reliable data transmission by detecting and possibly correcting errors that may occur in the Physical Layer. They also manage how devices share the transmission medium, preventing collisions and ensuring orderly communication.
