## CompTIA A+ Certification Exam: Core 1 Sample Questions (Q112-Q117):

### NEW QUESTION # 112

A new computer was plugged into a port that was used by a legacy network printer prior to the completion of an office remodeling project. The user who was assigned to the new computer has been reporting an issue with slow network speeds. A technician verified the NIC is functioning properly and the drivers are up to date, and then swaps out the Cat 6 patch cable. However, the issue persists. Which of the following troubleshooting steps should the technician take NEXT?

- A. Check the speed and duplex settings on the switch.

- B. Replace the cable that runs from the user's desk to the patch panel.
- C. Ensure settings within the computer's BIOS.
- D. Verify which port the VLAN is assigned to.

**Answer: A**

### NEW QUESTION # 113

Which of the following allows several websites from different companies to be housed on the same virtual server?

- A. Rapid elasticity
- B. High availability
- C. Shared resources
- D. Metered utilization

**Answer: C**

Explanation:

Shared resources is the concept that allows several websites from different companies to be housed on the same virtual server. A virtual server is a software-based server that runs on a physical server and can host multiple virtual machines (VMs). Each VM can run a different operating system and application, such as a website, and have its own allocated resources, such as CPU, memory, disk space, and network bandwidth.

However, the VMs share the underlying hardware resources of the physical server, which reduces the cost and complexity of maintaining separate servers for each website. This also enables rapid scalability, as new VMs can be created or deleted as needed. One of the methods to host multiple websites on the same virtual server is to use virtual hosts. Virtual hosts are a feature of web servers, such as Apache, that allow the web server to serve different websites based on the domain name or IP address requested by the client. For example, a web server can host two websites, a.example.com and b.example.com, on the same virtual server and the same port (such as 80 or 443), by using virtual hosts to map each domain name to a different document root directory. The web server will then deliver the content of the corresponding website to the client based on the domain name in the HTTP request header.

### NEW QUESTION # 114

An engineer is experiencing unexpected reboots on a graphics workstation when rendering complex 3-D models. The workstation is configured with a 115V power supply that is rated at 200W and connected to a UPS. The central processing unit contains 16 hyperthreaded cores, and a discrete graphics solution utilizing an 8-pin power connector is installed in a PCI Express x16 slot. Which of the following indicates where the technician should begin troubleshooting?

- A. The motherboard, as only standard PCI slots should be used for high-end graphics cards, not PCI Express slots
- B. The UPS, as 115V is insufficient for the configuration and should be increased to 220V
- C. The power supply, as 200W is insufficient when the GPU is heavily tasked
- D. The graphics card, as it is the component that triggers the unexpected reboots

**Answer: C**

Explanation:

The unexpected reboots on a graphics workstation when rendering complex 3-D models may be caused by insufficient power supply. The workstation is configured with a 115V power supply that is rated at 200W, which may not be enough when the GPU is heavily tasked. The technician should begin troubleshooting by checking the power supply.

### NEW QUESTION # 115

Given the following output from a cable tester:

= Open

=12345678=

=12 45 78=

Which of the following tools should the technician use to resolve this issue? (Select two).

- **A. Punchdown tool**
- B. Network tap
- C. Wi-Fi analyzer
- D. Toner probe
- **E. Crimper**
- F. Loopback plug

**Answer: A,E**

Explanation:

The output from the cable tester indicates that there is an open fault in the cable, which means that one or more of the wires in the cable are not connected properly or are broken. The open fault affects the wires 3, 4, and 6, which are used for transmitting and receiving data in Ethernet networks. The open fault can cause network connectivity issues, such as no link, slow speed, or packet loss<sup>12</sup>.

To resolve this issue, the technician should use a crimper and a punchdown tool, which are tools that are used to attach connectors to cables or wires to patch panels. A crimper is a tool that squeezes or crimps a connector, such as an RJ-45, to the end of a cable, ensuring that the wires are securely inserted into the pins of the connector. A punchdown tool is a tool that pushes or punches a wire into a slot on a patch panel, creating a connection between the wire and the panel. Both tools can be used to fix or replace the faulty wires or connectors that cause the open fault<sup>12</sup>.

The other options are not as effective or relevant as a crimper and a punchdown tool. A loopback plug is a tool that is used to test the functionality of a network port or device, by sending and receiving signals from the same port or device. A loopback plug can help diagnose network problems, such as faulty ports or devices, but it cannot fix the open fault in the cable<sup>12</sup>. A network tap is a tool that is used to monitor or capture network traffic, by creating a copy of the data that passes through a network link. A network tap can help analyze network performance, security, or troubleshooting, but it cannot fix the open fault in the cable<sup>12</sup>. A toner probe is a tool that is used to trace or identify a cable or wire, by sending and detecting an audible tone along the cable or wire. A toner probe can help locate or label network cables or wires, but it cannot fix the open fault in the cable<sup>12</sup>. A Wi-Fi analyzer is a tool that is used to scan or measure wireless networks, by displaying information such as signal strength, channel, encryption, etc. A Wi-Fi analyzer can help optimize or troubleshoot wireless networks, but it cannot fix the open fault in the cable<sup>12</sup>.

### NEW QUESTION # 116

Which of the following is the PRIMARY security concern with virtual machine escape?

- A. Rogue virtual machines installed on the hypervisor
- **B. Compromising the hypervisor**
- C. Cross-site scripting
- D. Overutilization of resources

**Answer: B**

Explanation:

The primary security concern with virtual machine escape is compromising the hypervisor, which can allow attackers to gain access to other virtual machines or the host system. Virtual machine escape refers to an attack that allows a guest virtual machine to break out of its isolated environment and access other parts of the system.
