Fortinet FCP - FortiAnalyzer 7.6 Analyst Sample Questions (Q17-Q22):

NEW QUESTION # 17

Which statement about the FortiSOAR management extension is correct?

- A. It does not include a limited trial by default.
- B. It requires a FortiManager configured to manage FortiGate.
- C. It runs as a docker container on FortiAnalyzer.
- **D. It requires a dedicated FortiSOAR device or VM.**

Answer: D

Explanation:

The FortiSOAR management extension is designed as an independent security orchestration, automation, and response (SOAR) solution that integrates with other Fortinet products but requires its own dedicated device or virtual machine (VM) environment. FortiSOAR is not natively integrated as a container or service within FortiAnalyzer or FortiManager, and it operates separately to manage complex security workflows and incident responses across various platforms.

NEW QUESTION # 18

Which two statements about local logs on FortiAnalyzer are true? (Choose two.)

- A. They are not supported in FortiView.
- B. Event logs are available only in the root ADOM.
- **C. You can view playbook logs for all ADOMs in the root ADOM.**
- **D. Event logs show system-wide information, whereas application logs are ADOM specific.**

Answer: C,D

Explanation:

Playbook logs, which relate to automated incident response actions, can be viewed centrally in the root ADOM, allowing visibility across all ADOMs.

Event logs on FortiAnalyzer typically provide system-wide information applicable to the entire FortiAnalyzer unit, while application logs are specific to each ADOM, reflecting the logs related to devices and activities managed within that ADOM.

- A. To identify the database log insertion status
- B. To view a list of scheduled reports
- **C. To display the SQL query connections and hcache status**
- D. To list the current SQL processes running

Answer: C

Explanation:

The command `diagnose sql status sqlreportd` is used in FortiAnalyzer to obtain specific information about the SQL reporting process and caching status. Here's what this command accomplishes and an analysis of each option:

Command Functionality:

`sqlreportd` is the FortiAnalyzer daemon responsible for managing SQL-based reporting processes. The `diagnose sql status sqlreportd` command provides information on active SQL query connections and the hcache (historical cache) status, which helps in monitoring and troubleshooting SQL report generation.
