## Salesforce Certified MuleSoft Associate Sample Questions (Q38-Q43):

### NEW QUESTION # 38

According to MuleSoft which system integration term describes the method, format and protocol used for communication between two systems?

- A. Component
- B. Interaction
- C. Message
- D. Interface

### Answer: D

Explanation:

In system integration, the term "interface" describes the method, format, and protocol used for communication between two systems. Here's a detailed explanation:

Interface:

Definition: An interface defines the point of interaction between two systems, specifying how data is exchanged, including the

communication method, data format, and protocol.

Components: Typically includes API endpoints, data formats (e.g., JSON, XML), communication protocols (e.g., HTTP, HTTPS), and authentication mechanisms.

Importance:

Standardization: Ensures that different systems can communicate effectively by adhering to predefined standards and protocols.

Interoperability: Facilitates seamless interaction and data exchange between disparate systems, enhancing overall integration.

Examples:

RESTful APIs: Define interfaces using HTTP/HTTPS and data formats like JSON or XML.

SOAP Web Services: Use XML-based messages and protocols such as HTTP or HTTPS for communication.

MuleSoft Documentation: System Integration Concepts

Interface Design: API Interface

## NEW QUESTION # 39

A MuleSoft developer must implement an API as a Mule application, run the application locally, and execute unit tests against the running application. Which Anypoint Platform component can the developer use to fulfill all of these requirements?

- A. Anypoint Studio
- B. API Designer
- C. Anypoint CLI
- D. API Manager

**Answer: A**

Explanation:

Anypoint Studio is the integrated development environment (IDE) provided by MuleSoft for designing, developing, and testing Mule applications. Here's how it fulfills the developer's requirements:

API Implementation:

Design and Development: Anypoint Studio provides a graphical interface to design and develop APIs as Mule applications using pre-built components and connectors.

Running Applications Locally:

Local Testing: Developers can run Mule applications locally within Anypoint Studio to test and debug them before deploying to production.

Unit Testing:

MUnit Integration: Anypoint Studio includes MUnit, MuleSoft's testing framework. Developers can create and execute unit tests directly within the IDE.

Test Execution: These tests can be run against the locally running Mule application to validate functionality and ensure code quality.

MuleSoft Documentation: Anypoint Studio

MUnit Testing: MUnit

## NEW QUESTION # 40

According to MuleSoft what is a major distinguishing characteristic of an application network in relation to the integration of systems, data, and devices?

- A. It uses CI/CD automation for real-time project delivery
- B. It uses a well-organized monolithic approach with standards
- C. It is built for change and self-service
- D. It leverages well-accepted internet standards like HTTP and JSON

**Answer: C**

Explanation:

An application network, as envisioned by MuleSoft, is designed to be dynamic and self-service, enabling rapid adaptation to changing business needs. Here's a detailed explanation:

Built for Change:

Flexibility: An application network allows for the easy addition, modification, and removal of services without disrupting existing functionalities.

Modular Architecture: Promotes a modular approach where services and APIs can be independently developed, deployed, and managed.

Self-Service:

Empowerment: Enables different teams (e.g., developers, business units) to access and use APIs and services without heavy reliance on central IT.

API-led Connectivity: Facilitates a self-service model where reusable APIs are available for various teams to integrate and build upon, accelerating innovation and reducing time-to-market.

Characteristics:

Decentralization: Unlike monolithic architectures, an application network supports decentralized development and deployment.

Reusability and Discoverability: Services and APIs are designed to be easily discoverable and reusable across different parts of the organization.

API-led Connectivity: MuleSoft API-led Connectivity

#### NEW QUESTION # 41

An IT integration team followed an API-led connectivity approach to implement an order-fulfillment business process. It created an order processing API that coordinates stateful interactions with a variety of microservices that validate, create and fulfill new product orders.

Which interaction composition pattern did the integration architect who designed this order processing API use?

- A. Orchestration
- B. Aggregation
- C. Streaming
- D. Multicasting

**Answer: A**

Explanation:

In an API-led connectivity approach, different APIs are layered to provide modular and reusable services. For an order processing API that coordinates stateful interactions with various microservices, the integration architect used the orchestration interaction composition pattern. Here's a step-by-step explanation:

Understanding Orchestration:

Definition: Orchestration involves coordinating multiple services to achieve a complex business workflow. Unlike choreography, which relies on each service knowing its part, orchestration uses a central controller to manage the interactions.

Role of the Orchestrator: The orchestrator manages the execution sequence, handles the state, and ensures all the necessary steps are completed successfully.

Order Processing API:

API-Led Connectivity: An order processing API, following API-led connectivity, sits in the Process layer, handling complex business processes and logic.

Stateful Interactions: Orchestration is particularly suitable for stateful interactions where the process needs to remember the state between steps, such as validating an order, creating it, and fulfilling it.

Implementation Steps:

Microservices Interaction: The order processing API interacts with various microservices:

Validation Microservice: Checks the validity of the order details.

Creation Microservice: Creates the order in the system.

Fulfillment Microservice: Manages the order fulfillment process.

Coordination: The API orchestrates these steps, ensuring each one completes successfully before moving to the next, handling exceptions, and maintaining the state of the process.

MuleSoft Documentation: Orchestration Pattern

#### NEW QUESTION # 42

An integration team follows MuleSoft's recommended approach to full lifecycle API development. Which activity should this team perform during the API implementation phase?

- A. Use the API specification to monitor the MuleSoft application
- B. Design the API specification
- C. Validate the API specification
- D. Use the API specification to build the MuleSoft application

**Answer: D**

#### Explanation:

MuleSoft recommends a full lifecycle API development approach which includes several phases such as design, implementation, testing, deployment, and management. During the API implementation phase, the primary activity is to use the API specification to build the MuleSoft application. Here's a detailed explanation:

#### API Design:

Create API Specification: Initially, an API specification is created using RAML or OAS (OpenAPI Specification) to define the API's structure, endpoints, request/response formats, and security requirements.

#### API Implementation:

Build Mule Application: Using the API specification as a blueprint, the development team implements the MuleSoft application. This involves creating flows, integrating with backend systems, and ensuring the API functions as specified.

APIKit: MuleSoft provides APIKit, a tool that automatically generates Mule flows based on the API specification, speeding up the development process.

Testing: During implementation, unit tests (using MUnit) and integration tests are created to ensure the API behaves as expected.

#### Validation and Monitoring:

Validate Against Specification: Throughout the implementation phase, the API is continuously validated against the original specification to ensure compliance.

Deployment and Monitoring: Post-implementation, the API is deployed, and tools like Anypoint Monitoring are used to monitor its performance and usage.

MuleSoft Documentation: Full Lifecycle API Management
