Our mission is to provide a comprehensive, convenient, and cost-effective preparation material for individuals to prepare for the NCP-MCA Certification Exam.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q80-Q85):

NEW QUESTION # 80

Save Playbook

Given input is invalid. No existing secret params found. password cannot XXXXXXXX have value.

An administrator is receiving the error shown in the exhibit while saving the Playbook.

What is causing this issue?

- A. There are no saved credentials found in the Playbook.
- B. Password Policy does not match for the given password.
- C. The given credentials do not have the access for execution.
- **D. The Playbook is cloned from another playbook with a password.**

Answer: D

Explanation:

The error message indicates that the password parameter is not a secret parameter, which means it is not encrypted and stored securely in the Calm database. This can happen when a Playbook is cloned from another Playbook that has a password parameter defined as a secret parameter. The cloned Playbook will inherit the password value from the original Playbook, but it will not be a secret parameter. To resolve this issue, the administrator needs to either delete the password parameter and create a new one as a secret parameter, or edit the password parameter and mark it as a secret parameter. NEW QUESTION # 81

A new Blueprint has been created for the Marketing Department and published to the Marketplace but is not visible to the Marketing Project Developers/Consumers.

What needs to be done to allow the Marketing Project to consume to the Marketplace Blueprint?

- A. The Blueprint needs to have a higher version number than previous Blueprints.
- B. The Blueprint needs to have the Published Category applied in the Marketplace Item.
- C. The Blueprint needs to have the Marketing Category assigned in the Marketplace Item.
- **D. The Blueprint needs to be Approved and Published with the Marketing Project.**

Answer: D

Explanation:

To make a Blueprint visible to a specific Project, it needs to be approved and published with that Project. This ensures that only authorized Blueprints are available for consumption by the Project members. Applying a Category or a version number to the Blueprint does not affect its visibility to the Project. NEW QUESTION # 82

A company wants to ensure that all developers are able to request new development environments on demand by using ServiceNow.

The administrator notices that even though developers create new environments, they rarely remove these environments when moving on to new assignments. Today, the administrator has gone into Prism Central to check when the VM was created, in order to reach out to the developer and ask if it can be deleted. The administrator has accidentally deleted the wrong VM in the past.

Which two methods can the administrator use to automate this task to avoid deleting the incorrect VMs?

(Choose two.)

- A. Create a playbook REST API trigger to delete the VM from a ServiceNow approval flow.
- B. Create a playbook webhook trigger to delete the VM from a ServiceNow approval flow.
- **C. Create a playbook REST API action to delete the VM from a ServiceNow approval flow.**
- **D. Create a playbook webhook action to delete the VM from a ServiceNow approval flow.**

Answer: C,D

Explanation:

A playbook REST API action allows the administrator to send an HTTP request to a specified endpoint, such as the Prism Central API, to perform an operation, such as deleting a VM. A playbook webhook action allows the administrator to send a payload to a

specified URL, such as a ServiceNow webhook, to trigger an event, such as an approval flow. Both of these actions can be used to automate the deletion of VMs from a ServiceNow approval flow, where the developers can request and confirm the removal of their environments.

A playbook webhook trigger and a playbook REST API trigger are not valid options, as they are used to initiate a playbook based on an external event, not to perform an action within a playbook. NEW QUESTION # 83

An administrator has a vendor-provided script that must be run at 9 am every Saturday on a Linux application VM. The administrator currently has a playbook that has a Time trigger and a VM SSH action to execute the script. However, the administrator has received a request to have the output of the script emailed to the application team when it is executed.

What is the easiest way to satisfy this request?

- A. Add an Email action to the end of the existing playbook and use the `{{action[index].response_body}}` parameter in the Message field.
- B. Modify the script to include a function to format the output of the script and email the output to the desired address.
- C. Add an Email action to the end of the existing playbook and use the `{{action[index].stdout}}` parameter in the Message field.
- D. Direct the output of the script to a file and use the Send Email with Payload action at the end of your existing playbook.

Answer: C

Explanation:

The easiest way to satisfy the request is to add an Email action to the end of the existing playbook and use the `{{action[index].stdout}}` parameter in the Message field. This way, the administrator does not need to modify the script or create a file to store the output. The `{{action[index].stdout}}` parameter will capture the standard output of the previous action, which is the VM SSH action that executes the script. The Email action will then send the output as the message body to the specified recipients.

NEW QUESTION # 84

What is one prerequisite for deploying Self-Service (formerly Calm)?

- A. The mDNS server is reachable from Prism Central.
- B. A unique Service IP address must be configured in the Prism web console cluster that is running on Prism, Central.
- C. A unique Virtual IP address must be configured in the Prism web console cluster that is running on Prism Central.
- D. At least 12 GB of memory is allocated.

Answer: C

Explanation:

One prerequisite for deploying Self-Service (formerly Calm) is that a unique Virtual IP address (VIP) must be configured in the Prism web console cluster that is running on Prism Central. This VIP is necessary for high availability and to ensure that Self-Service can be accessed reliably.
