CompTIA Security+ Certification Exam Sample Questions (Q434-Q439):

NEW QUESTION # 434

A security practitioner completes a vulnerability assessment on a company's network and finds several vulnerabilities, which the operations team remediates. Which of the following should be done next?

- A. Initiate a penetration test.
- B. Conduct an audit.
- C. Rescan the network.
- D. Submit a report.

Answer: C

NEW QUESTION # 435

Which of the following actions could a security engineer take to ensure workstations and servers are properly monitored for unauthorized changes and software?

- A. Collect and monitor all traffic exiting the network.
- B. Configure all systems to log scheduled tasks.
- C. Install endpoint management software on all systems.
- D. Block traffic based on known malicious signatures.

Answer: C

Explanation:

Endpoint management software is a tool that allows security engineers to monitor and control the configuration, security, and performance of workstations and servers from a central console. Endpoint management software can help detect and prevent unauthorized changes and software installations, enforce policies and compliance, and provide reports and alerts on the status of the endpoints. The other options are not as effective or comprehensive as endpoint management software for this purpose. References: CompTIA Security+ Study Guide: Exam SY0-701, 9th Edition, page 137 1

NEW QUESTION # 436

An administrator notices that several users are logging in from suspicious IP addresses. After speaking with the users, the administrator determines that the employees were not logging in from those IP addresses and resets the affected users' passwords. Which of the following should the administrator implement to prevent this type of attack from succeeding in the future?

- A. Password complexity
- B. Access management
- C. Permissions assignment
- D. Multifactor authentication

Answer: D

Explanation:

The correct answer is A because multifactor authentication (MFA) is a method of verifying a user's identity by requiring more than one factor, such as something the user knows (e.g., password), something the user has (e.g., token), or something the user is (e.g., biometric). MFA can prevent unauthorized access even if the user's password is compromised, as the attacker would need to provide another factor to log in. The other options are incorrect because they do not address the root cause of the attack, which is weak authentication. Permissions assignment (B) is the process of granting or denying access to resources based on the user's role or identity.

Access management is the process of controlling who can access what and under what conditions. Password complexity (D) is the requirement of using strong passwords that are hard to guess or crack, but it does not prevent an attacker from using a stolen password.

NEW QUESTION # 437

A company executive connects to various networks, such as hotel guest Wi-Fi, while traveling. A security analyst needs to provide a solution that will allow the executive to securely access the corporate internal resources. Which of the following would best meet this requirement?

- A. Jump server
- **B. VPN**
- C. Perimeter network
- D. EAP

Answer: B

Explanation:

A VPN establishes an encrypted tunnel over untrusted networks, ensuring the executive can securely access corporate internal resources from any location.

NEW QUESTION # 438

An administrator is reviewing a single server's security logs and discovers the following: Which of the following best describes the action captured in this log file?

- A. Privilege escalation
- B. Forgotten password by the user
- C. Failed password audit
- **D. Brute-force attack**

Answer: D

Explanation:

A brute-force attack is a type of attack that involves systematically trying all possible combinations of passwords or keys until the correct one is found. The log file shows multiple failed login attempts in a short amount of time, which is a characteristic of a brute-force attack. The attacker is trying to guess the password of the Administrator account on the server. The log file also shows the event ID 4625, which indicates a failed logon attempt, and the status code 0xC000006A, which means the user name is correct but the password is wrong. These are indicators of compromise (IoC) that suggest a brute-force attack is taking place. Reference: CompTIA Security+ Study Guide: Exam SY0-701, 9th Edition, page 215-216 and 223 1
