問題 #162

You have the following dataset.

When you use the dataset in a worksheet, you want Sales to appear automatically as shown in the following table.

What should you do?

- A. Change the default number format of the Sales field

- B. Create a calculated field that uses a formula of 'S' * str (Round((sales],2)) + 'k'
- C. Create a calculated field that uses a formula of 'S' + str (< (Sales)/1000)).
- D. Change the data type of the Sales field to String

答案： A

解題說明：

To make Sales appear automatically as shown in the second table, you should change the default number format of the Sales field. The default number format is how Tableau displays a field when you drag it to a worksheet. You can change the default number format by right-clicking on the field and selecting Default Properties > Number Format from the menu. This will open a dialog box where you can choose a category, such as Currency or Percentage, and customize the options, such as decimal places or prefixes. In this case, you want to change the default number format of Sales to Currency with zero decimal places and a custom prefix of "S". This will make Sales appear as "S" followed by the rounded value in thousands.

The other options are not correct for this scenario. Changing the data type of Sales to String will not affect how it appears on a worksheet. Creating a calculated field that uses a formula will not change the default number format of Sales, but create a new field that you have to drag to a worksheet. Converting Sales to Attribute will return only one value for each partition of data, which will not show any variation over time.

To achieve the formatting as shown in the example, where sales figures are displayed with a "K" to represent thousands and rounded to the nearest thousand (e.g., \$20K, \$44K, etc.), you would need to adjust the default number format of the Sales field in Tableau. By changing the default number format, every instance where the Sales field is used would automatically reflect this new formatting. This is more efficient than creating a calculated field as it preserves the numeric nature of the field, allowing for further numerical operations and aggregations.

問題 #163

You want to connect a Tableau workbook to a dataset in a Microsoft Excel spreadsheet. What should you do from Tableau Desktop?

- A. From the Data menu select New Data Source
- B. From the Data menu select Replace Data Source
- C. From the File menu select Import Workbook
- D. From the File menu select New

答案： A

解題說明：

To connect a Tableau workbook to a dataset in a Microsoft Excel spreadsheet, you need to select New Data Source from the Data menu. This will open the Connect pane, where you can choose Microsoft Excel as your data source and browse for your spreadsheet file. You can then drag and drop your sheets or tables to join or union them in the data source page. References:

[/connect_basic.htm https://help.tableau.com/current/pro/desktop/en-us/connect_excel.htm](https://help.tableau.com/current/pro/desktop/en-us/connect_excel.htm) When connecting to a dataset in Tableau Desktop, you would go to the 'Data' menu and select 'New Data Source'. This allows you to connect to various types of data sources, including Microsoft Excel spreadsheets, where you can then select the specific file you wish to connect to.

問題 #164

You want to show the cumulative total of each year for every state. Which quick table calculation should you use?

- A. Running Total
- B. YTD Growth
- C. YTD Total
- D. Year Over Year Growth

答案： A

問題 #165

A Data Analyst has created a Tableau Prep flow that is ready to be used. The output will be used by a colleague to build a dashboard on Tableau Cloud or Tableau Server.
Where should the analyst output the data to?

- A. Salesforce Data Cloud
- B. A Tableau data extract file
- C. CRM Analytics
- **D. A published data source**

答案：D

問題 #166

You need to change the values of a dimension without creating a new field.
What should you do?

- A. Rename the fields
- **B. Create aliases**
- C. Create groups
- D. Transforms the fields

答案：B

解題說明：

You can create aliases for the members of a dimension by right-clicking the dimension in the Data pane or in the view and selecting Aliases. This changes how the values are displayed in the view, but not the underlying data. For example, you can create an alias for "Central" as "Midwest".

In Tableau, aliases can be used to change the way dimension members appear without altering the underlying data. This is useful for display purposes and does not create a new field within the dataset.
