Getting the Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) certification exam is necessary in order to get a job in your desired tech company. Success in the Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) (NCP-MCA) certification exam gives you an edge over the others because you will have certified skills. The Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) certification exam badge will make a good impression on the interviewer. Most of the people planning to attempt the NCP-MCA Exam are confused that how will they prepare and pass NCP-MCA exam with good grades.

The NCP-MCA certification exam covers a range of topics related to multicloud automation. These topics include Nutanix Calm, which is Nutanix's application automation and orchestration solution, as well as other Nutanix technologies such as Prism Central, AHV, and Xi Cloud Services. NCP-MCA exam assesses an individual's knowledge of these technologies and their ability to use them to automate IT operations across multicloud environments. NCP-MCA Exam also covers topics related to DevOps methodologies and practices, such as continuous integration and continuous deployment (CI/CD), as well as infrastructure as code (IaC) and automation frameworks.

While buying NCP-MCA training materials online, you may pay more attention to money safety. If you choose NCP-MCA learning materials of us, we can ensure you that your money and account safety can be guaranteed. Since we have professional technicians check the website every day, therefore the safety can be guaranteed. In addition, NCP-MCA Training Materials of us are high quality, they contain both questions and answers, and it's convenient for you to check answers after practicing. We have online chat service stuff, if you have any questions about NCP-MCA learning materials, you can have a conversation with us.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q99-Q104):

NEW QUESTION # 99

Which products or features are dependencies of Calm? (Choose two.)

- A. Data Service IP
- **B. Prism Central**
- C. Block Storage IP
- **D. Prism Element**

Answer: B,D

Explanation:

Nutanix Calm is a feature of Prism Central that enables you to automate the deployment and management of infrastructure and applications across multiple clouds. Prism Central is a centralized management plane that provides unified visibility and control over Nutanix clusters and services. Prism Element is the local management plane for each Nutanix cluster that runs the Acropolis Operating System (AOS). Both Prism Central and Prism Element are required for Nutanix Calm to function properly and access the resources and services of the Nutanix platform. References:

NEW QUESTION # 100

Which Nutanix product version must be compatible to deploy Self-service (formerly Calm)?

- A. AOS
- B. AHV
- **C. Prism Central**
- D. Prism Element

Answer: C

Explanation:

To deploy Self-Service (formerly Calm), the Nutanix product version that must be compatible is Prism Central. Self-Service relies on Prism Central for orchestration, management, and automation of applications and services across multiple environments.

NEW QUESTION # 101

Which permission level grants access to Create, Update, Delete, and Duplicate Blueprints?

- A. Domain Admin
- B. Consumer
- C. Operator
- **D. Developer**

Answer: D

Explanation:

A Developer permission level grants access to create, update, delete, and duplicate blueprints in Nutanix Calm¹. A Developer can also launch, manage, and delete applications from blueprints, as well as create, update, delete, and duplicate runbooks². A Consumer can only launch and manage applications from blueprints, but cannot modify them². An Operator can launch, manage, and delete applications from blueprints, as well as run and manage runbooks, but cannot create or modify them². A Domain Admin can perform all the actions of a Developer and an Operator, as well as manage projects, categories, and endpoints². References:

NEW QUESTION # 102

Which two groups of operations can a Prism Admin or Super Admin role perform? (Choose two.)

- A. Create, read, automate, delete, enable, and run playbooks
- B. Create, read, automate, or delete an action template in the action gallery
- C. Create, read, update, or delete an action template in the action gallery
- D. Create, read, update, delete, enable, and run playbooks

Answer: C,D

NEW QUESTION # 103

A new monitoring application is being rolled out across the Organization. An administrator has been tasked with automating the installation of the local agent on all Linux VMs.

The current environment has the following VMS deployed:

18 VMS created pre-Calm adoption.

32 VMS created post-Calm adoption.

Which action should the administrator take to automate this deployment for existing VMs?

- A. In Calm, create a Brownfield deployment attaching to both pre-Calm and post-Calm created VMS and add the Agent installation script to the Blueprint.
- B. Create a new golden image that includes the monitoring client and deploy all VMS again to bring them under Calm management.
- C. In Calm, create an Endpoint that includes all Linux VMS and include the Endpoint a Runbook that executes a shell script for agent installation.

Answer: C

Explanation:

The best option to automate the installation of the local agent on all Linux VMs is to create an Endpoint that includes all Linux VMs and include the Endpoint in a Runbook that executes a shell script for agent installation. This way, the administrator can leverage the Calm Runbook feature, which allows orchestrating tasks across multiple VMs without the need of a blueprint or an application. The administrator can also filter the VMs by name, tag, or other criteria to select the target VMs for the Endpoint. The shell script can be added as a task in the Runbook and run on the selected Endpoint.

Option A is not correct because a Brownfield deployment is used to create an application from existing VMs and an existing blueprint. It is not suitable for automating tasks across multiple VMs without a blueprint. Moreover, a Brownfield deployment cannot attach to post-Calm created VMs, as they are already managed by Calm.

Option C is not correct because creating a new golden image and deploying all VMs again is a very time-consuming and disruptive process. It also requires the administrator to migrate the data and configuration of the existing VMs to the new ones. This option does not leverage the Calm automation capabilities and is not recommended.
