## Free PDF Medical Technology - PTC-AMCA - Newest AMCA Phlebotomy Technician Certification Exam Trustworthy Dumps

Clients always wish that they can get immediate use after they buy our PTC-AMCA Test Questions because their time to get prepared for the exam is limited. Our PTC-AMCA test torrent won't let the client wait for too much time and the client will receive the mails in 5-10 minutes sent by our system. Then the client can log in and use our software to learn immediately. It saves the

client's time.

## Medical Technology AMCA Phlebotomy Technician Certification Exam Sample Questions (Q139-Q144):

### NEW QUESTION # 139

Which of the following statements regarding patient identification is FALSE?

- A. A patient's response when his or her name is called is not sufficient for identification.
- B. An outpatient should be asked to state his or her name and date of birth.
- C. An outpatient may be identified by an ID card.
- D. If a patient has been identified by the receptionist no further verification is needed.

**Answer: D**

Explanation:

The phlebotomist should always verify a patient's ID, even if he or she has been identified by the receptionist or has responded when his or her name has been called. Some outpatients may have been issued an ID card by the clinic; however, outpatients should still be asked to confirm their name and date of birth.

### NEW QUESTION # 140

The most common reason for rejecting a specimen for chemistry is:

- A. An underfilled tube
- B. Clotting
- C. An overfilled tube
- D. Hemolysis

**Answer: D**

Explanation:

The most common reason for rejecting a specimen for chemistry is hemolysis, whereas the most common reason for rejecting a specimen for hematology is clotting. Other reasons that specimens may be rejected include overfilling or underfilling a tube, because this alters the required ratio of additive to specimen and can interfere with the testing results. Specimens transported and handled in the wrong collection tube, at the wrong temperature, with the wrong additive, or with exposure to light (if photosensitive) may also be rejected.

### NEW QUESTION # 141

Mouth pipetting of a blood sample is:

- A. Reserved for pathologists only
- B. Optional
- C. Prohibited
- D. Used for skin punctures only

**Answer: C**

Explanation:

Mouth pipetting which involves sucking a laboratory specimen into an open-ended tube, was once common practice in laboratories, but the practice was generally stopped in the 1970s when mechanical pipettes became available. However, mouth pipetting is still commonly used in developing nations where medical supplies are scarce and equipment is often outdated, so phlebotomists who work overseas should be aware that the practice puts them at high risk of disease and should never be utilized.

### NEW QUESTION # 142

With RIDTs, both positive and negative test results are more likely to be accurate if the sample is obtained within:

- A. 2 days of the onset of symptoms

- B. 4 days of the onset of symptoms
- C. 7 days of the onset of symptoms
- D. 1 day of the onset of symptoms

**Answer: B**

Explanation:

With rapid influenza diagnostic tests (RIDTs), both positive and negative test results are more likely to be accurate if the sample is obtained within 4 days of the onset of symptoms. Both false negatives and false positives may occur, although false negatives are more common than false positives. Various tests are available. Some differentiate between influenza A and influenza B, and others do not. Different types of specimens (e.g., nasal, throat swab) are required, depending on the manufacturer.

#### **NEW QUESTION # 143**

When obtaining a blood specimen for coagulation tests (PT, aPTT), when is the use of a discard tube indicated?

- A. It is indicated when a winged (butterfly) blood collection set is used and the coagulation tube is filled first.
- B. It is always indicated when obtaining a blood specimen for coagulation tests.
- C. It is never indicated when obtaining a blood specimen for coagulation tests.
- D. It is indicated whenever the coagulation tube is the first tube needed.

**Answer: A**

Explanation:

When obtaining a blood specimen for coagulation tests (PT, aPTT), the use of a discard tube is indicated when a winged (butterfly) blood collection set is used and the coagulation tube is filled first. At one time, it was standard procedure to obtain a discard tube of 5 mL of blood when the coagulation tube was the first tube to be filled, but studies have indicated that this is not necessary when using a straight needle. However, when using a winged (butterfly) needle, the discard tube is collected in order to prime the tubing so that the correct ratio of blood to anticoagulant is maintained.

#### **NEW QUESTION # 144**

.....

PTC-AMCA study guide is highly targeted. Good question materials software can really bring a lot of convenience to your learning and improve a lot of efficiency. How to find such good learning material software? People often take a roundabout route many times. If you want to use this PTC-AMCA Practice Exam to improve learning efficiency, our PTC-AMCA exam questions will be your best choice and you will be satisfied to find its good quality and high efficiency.
