Exam Dumps SY0-701 Zip, SY0-701 Reliable Test Guide
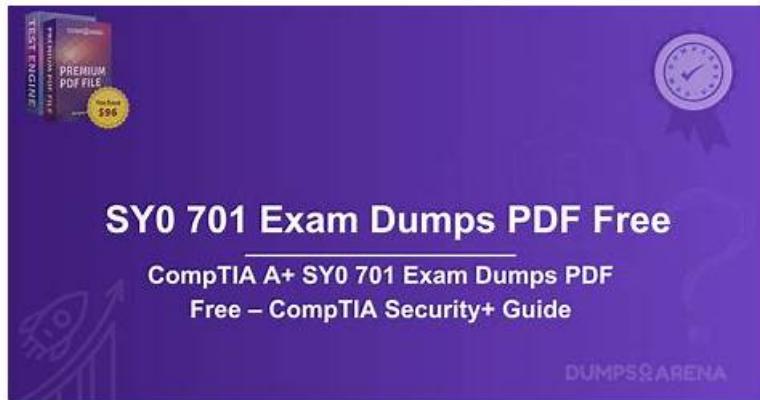

One of the major features provided by CompTIA is that it will provide you with free CompTIA SY0-701 actual questions updates for 365 days after the purchase of our product. If you work hard with our CompTIA SY0-701 Exam Practice material, nothing can stop you from cracking the test on the first endeavor.

CompTIA SY0-701 Exam Syllabus Topics:

Topic	Details
Topic 1	• Security Program Management and Oversight: Finally, this topic discusses elements of effective security governance, the risk management process, third-party risk assessment, and management processes. Additionally, the topic focuses on security compliance requirements, types and purposes of audits and assessments, and implementing security awareness practices in various scenarios.
Topic 2	• Security Architecture: Here, you'll learn about security implications across different architecture models, applying security principles to secure enterprise infrastructure in scenarios, and comparing data protection concepts and strategies. The topic also delves into the importance of resilience and recovery in security architecture.
Topic 3	• General Security Concepts: This topic covers various types of security controls, fundamental security concepts, the importance of change management processes in security, and the significance of using suitable cryptographic solutions.
Topic 4	• Security Operations: This topic delves into applying common security techniques to computing resources, addressing security implications of proper hardware, software, and data asset management, managing vulnerabilities effectively, and explaining security alerting and monitoring concepts. It also discusses enhancing enterprise capabilities for security, implementing identity and access management, and utilizing automation and orchestration for secure operations.
Topic 5	• Threats, Vulnerabilities, and Mitigations: In this topic, you'll find discussions comparing threat actors and motivations, explaining common threat vectors and attack surfaces, and outlining different types of vulnerabilities. Moreover, the topic focuses on analyzing indicators of malicious activity in scenarios and exploring mitigation techniques used to secure enterprises against threats.

CompTIA SY0-701 Desktop Practice Exam Questions Software

What is more difficult is not only passing the CompTIA SY0-701 Certification Exam, but the acute anxiety and the excessive burden

also make the candidate nervous to qualify for the CompTIA Security+ Certification Exam certification. If you are going through the same tough challenge, do not worry because CompTIA is here to assist you.

CompTIA Security+ Certification Exam Sample Questions (Q213-Q218):

NEW QUESTION # 213
A security analyst is reviewing the source code of an application in order to identify misconfigurations and vulnerabilities. Which of the following kinds of analysis best describes this review?

- A. Gap
- B. Dynamic
- C. Static
- D. Impact

Answer: C

Explanation:
Static code analysis entails the review of source code and it is static because it is not running on a computer. This is the opposite of dynamic code analysis which is done while the code is actually executing on the computer system.

NEW QUESTION # 214
Which of the following describes the difference between encryption and hashing?

- A. Encryption uses a public-key exchange, while hashing uses a private key.
- B. Encryption protects data in transit, while hashing protects data at rest.
- C. Encryption replaces cleartext with ciphertext, while hashing calculates a checksum.
- D. Encryption ensures data integrity, while hashing ensures data confidentiality.

Answer: C

NEW QUESTION # 215
A company is utilizing an offshore team to help support the finance department. The company wants to keep the data secure by keeping it on a company device but does not want to provide equipment to the offshore team. Which of the following should the company implement to meet this requirement?

- A. VPC
- B. VPN
- C. VDI
- D. MDM

Answer: C

Explanation:
Virtual Desktop Infrastructure (VDI) allows a company to host desktop environments on a centralized server. Offshore teams can access these virtual desktops remotely, ensuring that sensitive data stays within the company's infrastructure without the need to provide physical devices to the team. This solution is ideal for maintaining data security while enabling remote work, as all data processing occurs on the company's secure servers.

NEW QUESTION # 216
Cadets speaking a foreign language are using company phone numbers to make unsolicited phone calls lo a partner organization. A security analyst validates through phone system logs that the calls are occurring and the numbers are not being spoofed. Which of the following is the most likely explanation?

- A. The service provider has assigned multiple companies the same numbers
- B. Disgruntled employees are making calls to the partner organization.
- C. The company's SIP server security settings are weak.
- D. The executive team is traveling internationally and trying to avoid roaming charges

Answer: C

Explanation:
If cadets are using company phone numbers to make unsolicited calls, and the logs confirm the numbers are not being spoofed, it suggests that the SIP (Session Initiation Protocol) server's security settings might be weak. This could allow unauthorized access or exploitation of the company's telephony services, potentially leading to misuse by unauthorized individuals.

NEW QUESTION # 217
Which of the following roles, according to the shared responsibility model, is responsible for securing the company's database in an IaaS model for a cloud environment?

- A. Cloud provider
- B. Third-party vendor
- C. Client
- D. DBA

Answer: C

Explanation:
According to the shared responsibility model, the client and the cloud provider have different roles and responsibilities for securing the cloud environment, depending on the service model. In an IaaS (Infrastructure as a Service) model, the cloud provider is responsible for securing the physical infrastructure, such as the servers, storage, and network devices, while the client is responsible for securing the operating systems, applications, and data that run on the cloud infrastructure. Therefore, the client is responsible for securing the company's database in an IaaS model for a cloud environment, as the database is an application that stores data. The client can use various security controls, such as encryption, access control, backup, and auditing, to protect the database from unauthorized access, modification, or loss. The third-party vendor and the DBA (Database Administrator) are not roles defined by the shared responsibility model, but they may be involved in the implementation or management of the database security.
