To make an open entrance and cash, everybody should gather themselves with the right and built up base on material for Microsoft AZ-800. The top-notch highlights are given to clients to affect the essential undertaking in certification. Every one of you can test your course of action with Microsoft AZ-800 Dumps by giving the phony test. Mock tests are outstandingly worked for you to make heads or tails of your goofs while giving Microsoft AZ-800.

The Microsoft AZ-800 exam is intended for IT professionals who have experience in implementing and managing Windows Server technologies, as well as in deploying and managing cloud-based solutions. It is also recommended that candidates have knowledge of networking, virtualization, and storage solutions. AZ-800 Exam consists of multiple-choice questions and is conducted online.

Exam Microsoft AZ-800 Introduction | Real AZ-800 Questions

Well preparation is half done, so choosing good AZ-800 training materials is the key of clear exam in your first try with less time and efforts. Our website offers you the latest preparation materials for the AZ-800 real exam and the study guide for your review. There are three versions according to your study habit and you can practice our AZ-800 Dumps PDF with our test engine that help you get used to the atmosphere of the formal test.

Microsoft Administering Windows Server Hybrid Core Infrastructure Sample Questions (Q249-Q254):

NEW QUESTION # 249

You need to sync files from an on premises server named Server1 to Azure by using Azure File Sync.

You have a cloud tiering policy that is configured for 30 percent free space and 70 days.

Volume E on Server1 is 500 GB.

A year ago, you configured E:\Data on Server1 to sync by using Azure File Sync. The files that are visible in E:\Data are shown in the following table.

☐ Volume E does NOT contain any other files.

Where are File1 and File3 located? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

☐ Reference:

<https://docs.microsoft.com/en-us/windows-server/manage/windows-admin-center/azure/azure-file-sync>

<https://docs.microsoft.com/en-us/azure/storage/file-sync/file-sync-cloud-tiering-overview>

NEW QUESTION # 250

Your network contains the segments shown in the following table.

You have servers that run Windows Server and are configured as shown in the following table.

You deploy a server named Server4 that runs Windows Server and has a static IP address of 172.16.1.1. You connect Server4 to Segment1.

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

NEW QUESTION # 251

Your network contains an Active Directory Domain Services (AD DS) domain named contoso.com. The domain contains a DNS server named Server1. Server1 hosts a DNS zone named fabrikam.com that was signed by DNSSEC.

You need to ensure that all the member servers in the domain perform DNSSEC validation for the fabrikam.com namespace.

What should you do?

- A. On Server1, run the Add-DnsServerTrustAnchor cmdlet.
- B. From a Group Policy Object (GPO), modify the Network List Manager policies.
- C. On each member server, run the Add-DnsServerTrustAnchor cmdlet.
- **D. From a Group Policy Object (GPO), add a rule to the Name Resolution Policy Table (NRPT).**

Answer: D

Explanation:

The hybrid core curriculum explains that DNSSEC validation by Windows clients is controlled through the Name Resolution Policy Table (NRPT), deployable via Group Policy. The NRPT lets administrators "require DNSSEC for specific namespaces and configure how clients validate responses." While trust anchors (Add-DnsServerTrustAnchor) are used by DNS servers performing validation, member servers acting as DNS clients rely on NRPT rules to demand DNSSEC-validated answers from their resolvers for named namespaces (e.g., fabrikam.com). The guidance emphasizes: to "enforce DNSSEC validation on domain-joined clients for a given suffix, create a GPO-based NRPT rule that requires DNSSEC," ensuring unsigned or invalid answers are rejected. Therefore, to make all member servers validate DNSSEC for fabrikam.com, deploy a GPO NRPT rule targeting that namespace. Adding trust anchors on Server1 or on each member server is unnecessary (and in the latter case, inapplicable unless they run the DNS Server role).

NEW QUESTION # 252

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You are planning the deployment of DNS to a new network.

You have three internal DNS servers as shown in the following table.

The contoso.local zone contains zone delegations for east.contoso.local and west.contoso.local. All the DNS servers use root hints.

You need to ensure that all the DNS servers can resolve the names of all the internal namespaces and internet hosts.

Solution: On Server2, you create a conditional forwarder for contoso.local and west.contoso.local. On Server3, you create a conditional forwarder for contoso.local and east.contoso.local.

Does this meet the goal?

- **A. Yes**
- B. No

Answer: A

NEW QUESTION # 253

You have a server named Server1 that runs Windows Server. Server1 has a single network interface and the Hyper-V virtual switches shown in the following exhibit.

Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

The Hyper-V networking section of the Administering Windows Server Hybrid Core Infrastructure material explains that Hyper-V provides three virtual switch types: External, Internal, and Private. It states:

"An External switch is bound to a physical NIC and can optionally connect the management OS; an Internal switch connects VMs to each other and to the host only; a Private switch connects VMs to each other only (no host access)." The guide further clarifies limits on external switches: "A single physical adapter can be bound to only one External virtual switch at a time (unless using NIC Teaming). Additional External switches require additional physical adapters." In the exhibit, Server1 has a single NIC already bound to vSwitch3, and the tree shows 'Microsoft Hyper-V Network Adapter', indicating the management OS shares the adapter. Therefore, you cannot add another External switch with the lone NIC; you can still create Internal and Private switches.

Regarding host connectivity, the guide specifies: "The management OS can communicate with VMs attached to an Internal switch and to an External switch (when the management OS is connected). The host cannot communicate with VMs on a Private switch." Consequently, Server1 can access network shares only from VMs on vSwitch2 (Internal) or vSwitch3 (External with management OS), but not from VMs on vSwitch1 (Private).

NEW QUESTION # 254

.....

If you are very tangled in choosing a version of AZ-800 practice prep, or if you have any difficulty in using it, you can get our help. We provide you with two kinds of consulting channels. You can contact our online staff or you can choose to email us on the AZ-800 Exam Questions. No matter which method you choose, as long as you ask for AZ-800 learning materials, we guarantee that we will reply to you as quickly as possible.
