## ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q275-Q280):

### NEW QUESTION # 275

Select the roles required in a formal review:

- A. Author. Developer, Facilitator. Review Leader. Reviewers. Scribe
- B. Author, Business analyst. Facilitator, Review Leader. Reviewers. Scribe
- C. Author, Tester. Facilitator. Review Leader. Reviewers. Scribe
- **D. Author, Management, Facilitator, Review Leader, Reviewers, Scribe**

**Answer: D**

Explanation:

In a formal review, the roles involved typically include the author, management, facilitator (also known as moderator), review leader, reviewers, and scribe. Each role has specific responsibilities to ensure the effectiveness and efficiency of the review process:

- \* The author creates and refines the work product being reviewed.
- \* Management allocates resources and supports the review process.
- \* The facilitator manages the review meeting, ensuring it proceeds smoothly.
- \* The review leader plans the review and ensures it meets its objectives.
- \* Reviewers examine the work product to identify defects.
- \* The scribe records issues raised during the review meeting.

#### NEW QUESTION # 276

Consider the following testing levels:

- 1) Component Testing
- 2) Integration Testing
- 3) System Testing
- 4) Acceptance Testing

Which of the following statements is true?

- A. All testing levels are applicable, independent of which software development life-cycle process (V- model, iterative, incremental) is used.
- B. Integration and system testing are applicable when V-model is used.  
Component and acceptance testing are applicable when iterative development models are used.
- C. All the testing levels are applicable to V-model for software development.  
Only acceptance testing is applicable for iterative models.
- D. Acceptance testing is applicable for all software development models.  
Component and system testing are applicable only for the V-model.

**Answer: A**

Explanation:

All testing levels are applicable, independent of which software development life-cycle process (V-model, iterative, incremental) is used. Testing levels are defined based on the scope and objectives of testing, not on the software development model. Component testing, integration testing, system testing and acceptance testing are common testing levels that can be applied to any software development model, as long as they are planned and executed properly. The V-model is a software development model that emphasizes the relationship between each development phase and its corresponding testing phase. Iterative and incremental models are software development models that divide the development process into smaller cycles or iterations, where each iteration produces a working version of the software that can be tested and evaluated.

#### NEW QUESTION # 277

The following part of a business process flow is specified; REPEAT (book a bill) UNTIL (User presses Cancel). How many test cases are necessary in order to achieve 100% branch coverage of the process flow?

- A. 0
- B. Infinite
- C. 1
- D. 2

**Answer: A**

Explanation:

To achieve 100% branch coverage of the process flow, we need to test both the true and false outcomes of the condition (User presses Cancel). Branch coverage is a type of structural testing that measures how many decision outcomes in a program have been executed by a test suite. Branch coverage can be used to assess the adequacy or completeness of a test suite.

To test the true outcome of the condition, we need a test case that simulates the user pressing Cancel after booking a bill. This test case will exit the loop and end the process flow.

To test the false outcome of the condition, we need a test case that simulates the user not pressing Cancel after booking a bill. This test case will repeat the loop and book another bill.

Therefore, we need at least two test cases to achieve 100% branch coverage of the process flow. One test case for each possible

outcome of the condition.

#### NEW QUESTION # 278

You are testing the latest version of an air-traffic control system prior to production deployment using exploratory testing. After following an unusual sequence of input steps, the system crashes. After the crash, you document a defect report with the following information:

- \*Title: System crashes unexpectedly during input.
- \*Brief summary: System crashes when an unusual sequence of inputs is used.
- \*Version: V1.001
- \*Test: Exploratory testing prior to production deployment
- \*Priority: Urgent
- \*Risk: High
- \*References: Screenshot of crashed application

What critical Information Is missing from this report?

- A. Conclusions, recommendations, and approvals.
- **B. Description of the defect to enable reproduction.**
- C. Change history.
- D. Status of defect

**Answer: B**

Explanation:

The critical information missing from the defect report is a detailed description of the defect to enable reproduction. A clear and concise description of the steps taken to reproduce the defect is essential for developers to understand the context and to be able to replicate the issue in their environment. Without this information, it can be challenging to diagnose and fix the defect. The ISTQB CTFL syllabus emphasizes the importance of providing all necessary details in a defect report to facilitate effective communication and resolution.

#### NEW QUESTION # 279

Which description reflects aspects of checklist-based testing?

- A. The checklist contains common testing techniques (e.g. equivalence class partitioning) and their uses to simplify the selection of the "appropriate" test techniques.
- **B. The checklist contains experience-based test conditions, mostly in the form of questions and based on causes of previous failures, which are used when creating the test.**
- C. The checklist contains test cases that need to be executed in a certain order (e.g. defect-detecting test cases from previous projects).
- D. The checklist includes failure descriptions that have been found in the past which should be avoided.

**Answer: B**
