

Reliable F5CAB1 Test Book | F5CAB1 New Braindumps Book

2026 Latest TrainingQuiz F5CAB1 PDF Dumps and F5CAB1 Exam Engine Free Share: <https://drive.google.com/open?id=1cnGFxd-DH2g68GkDEEgqRci4bzbGZ0Z0>

Nowadays, all of us are living a fast-paced life and we have to deal with things with high-efficiency. We also develop our F5CAB1 practice materials to be more convenient and easy for our customers to apply and use. The most advanced operation system in our F5CAB1 Exam Questions which can assure you the fastest delivery speed, and your personal information will be encrypted automatically by our operation system. Within several minutes, you will receive our F5CAB1 study guide!

F5 F5CAB1 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• BIG IP Administration Support and Troubleshooting: This section of the exam measures skills of Network Administrators and covers identifying and resolving common issues that affect BIG IP operation. It focuses on using logs, statistics, diagnostic tools, and basic troubleshooting methods to restore normal traffic flow and maintain stable application delivery.
Topic 2	<ul style="list-style-type: none">• BIG IP Administration Data Plane Configuration: This section of the exam measures skills of System Administrators and covers configuring BIG IP objects that control data plane behavior. It focuses on setting up virtual servers, pools, nodes, monitors, and profiles so that applications are delivered reliably and efficiently according to design requirements.

Topic 3	<ul style="list-style-type: none"> • BIG IP Administration Control Plane Administration: This section of the exam measures skills of System Administrators and covers managing the control plane where BIG IP is configured and administered. It includes working with user accounts, roles, device settings, configuration management, and using the graphical interface and command line for daily administrative tasks.
Topic 4	<ul style="list-style-type: none"> • BIG IP Administration Data Plane Concepts: This section of the exam measures skills of Network Administrators and covers how BIG IP handles application traffic on the data plane. It includes understanding flow of traffic, key data path components, basic concepts of load balancing, and how security and performance features affect user traffic.
Topic 5	<ul style="list-style-type: none"> • BIG IP Administration Install Initial Configuration and Upgrade: This section of the exam measures skills of System Administrators and covers the lifecycle tasks for deploying and maintaining a BIG IP system. It includes installing the platform, performing initial setup, applying licenses, configuring basic networking, and planning and executing software upgrades and hotfixes.

Quiz F5CAB1 - BIG-IP Administration Install, Initial Configuration, and Upgrade High Hit-Rate Reliable Test Book

F5 F5CAB1 practice exam support team cooperates with users to tie up any issues with the correct equipment. If BIG-IP Administration Install, Initial Configuration, and Upgrade material changes, CertsFire also issues updates free of charge for three months following the purchase of our F5 F5CAB1 Exam Questions.

F5 BIG-IP Administration Install, Initial Configuration, and Upgrade Sample Questions (Q27-Q32):

NEW QUESTION # 27

An administrator is in the process of reactivating the license using the interface displayed in the exhibit.

What is the address of the license server to which the BIG-IP device must be able to establish an outbound connection in order to use the Automatic Activation Method?

- A. license.f5.com
- B. callhome.f5.com
- C. ask.f5.com

- D. activate.f5.com

Answer: D

Explanation:

When you choose Automatic as the activation method in the License , Re-activate screen, the BIG-IP device itself contacts F5's license activation service over the Internet.

For successful automatic activation:

- * The BIG-IP must have outbound network connectivity (typically via the management interface).
- * DNS resolution and routing must allow it to reach the F5 license activation host (the one shown in option D).
- * The device sends its dossier and registration key to that service and receives an updated license file in return, which is then installed automatically.

The other hostnames in the options are not used by BIG-IP for license activation, so they cannot be correct in the context of Automatic Activation.

NEW QUESTION # 28

A new logging solution is being implemented on the network. Policy requires keeping management traffic sent from the BIG-IP out of the management interface. After configuring the BIG-IP to forward messages to the new Syslog server, the BIG-IP Administrator notices that packets are being sent from a numbered data-plane Self IP.

What should the BIG-IP Administrator change to send the traffic out of the correct interface?

- A. Create a new Self IP in the same subnet as the management IP address using a route domain.
- B. [Create a Management Route for the specific address/subnet of the syslog service via TMSH.](#)
- C. Modify the port lockdown settings on the Self IP address to allow UDP port 514 traffic.
- D. Set the Management IP as the source address when configuring a Remote Syslog destination.

Answer: B

Explanation:

By default, management-plane traffic uses the management routing table, while data-plane traffic uses the TMM routing table. Remote Syslog traffic is management-plane traffic unless a management route exists.

If no Management Route matches the Syslog server's destination IP, the BIG-IP will instead:

- * Use TMM routes, and
- * Source the packets from a Self IP

This is exactly what the administrator is observing.

To force Syslog traffic out the management port:

You must create a Management Route, which is configured using:

`tmsl create /sys management-route <name> gateway <ip> network <syslog subnet>` This sends syslog traffic:

- * Out of the management interface
- * Using the Management IP as the source

Thus, Option B is correct.

Why the other options are incorrect:

A). Set the Management IP as the source address

- * Source address selection is overridden by routing.
- * Without a management route, traffic still goes out the data plane.

C). Create a new Self IP using a route domain

- * Unnecessary and not related to management-plane routing.
- * Syslog traffic should not rely on data-plane Self IPs.

D). Modify port lockdown on Self IP to allow UDP/514

- * This would allow Syslog traffic into the BIG-IP over a Self IP, not force outbound traffic via management.

NEW QUESTION # 29

For security reasons, a BIG-IP Administrator needs to specify allowable IP ranges for access to the Configuration Utility (WebUI). The exhibit shows the User Administration section of the Configuration Utility.

The administrator could not find any setting that explicitly restricts access to the Configuration Utility. Which one of the following is a reason for that?

- A. The administrator needs to switch to the "Advanced" view mode in order to display the relevant setting
- B. The administrator must restrict access by IP address for SSH, which will implicitly restrict access to the Configuration Utility
- C. To avoid locking out the administrator, recent versions of BIG-IP no longer allow restricting administrator access to the Configuration Utility by source IP address
- D. Restricting access to the Configuration Utility can only be done from the Command Line Interface

Answer: D

Explanation:

The screenshot shown is from the User Administration section of the BIG-IP GUI.

This section controls:

- * Root and Admin passwords
- * SSH Access
- * SSH IP Allow settings

However, it does not contain any controls for restricting access to the WebUI (TMUI).

BIG-IP does not provide TMUI access restrictions from this part of the GUI.

Access to the web-based Configuration Utility is controlled by the `httpd` allow list, configured through TMSH:

```
tmsh modify /sys httpd allow { <IP/subnet> }
```

This setting is not displayed in the User Administration panel, and in many BIG-IP versions, the `httpd` allow list is only configurable from the CLI, not the GUI.

Therefore, the administrator cannot find the setting in the screen shown because:

- * TMUI access restriction is not located in this GUI section
- * It must be configured using `tmsh` under `/sys httpd allow`

This is why Option A is correct.

NEW QUESTION # 30

A BIG-IP Administrator plans to upgrade a BIG-IP device to the latest TMOS version.

Which two tools could the administrator leverage to verify known issues for the target versions? (Choose two.)

- A. F5 iHealth
- B. F5 End User Diagnostics (EUD)
- C. F5 University
- D. F5 Bug Tracker
- E. F5 Downloads

Answer: A,D

Explanation:

Comprehensive and Detailed Explanation (Paraphrased from F5 BIG-IP Administration Install, Initial Configuration, and Upgrade concepts) When performing a TMOS upgrade, F5 recommends validating the target software version to ensure that the release does not contain defects that may impact system behavior. The upgrade preparation process includes checking for known issues, validating compatibility, and reviewing advisory information for the intended version. Two primary F5 tools serve this purpose:

B). F5 iHealth

iHealth is a cloud-based diagnostic and analysis platform used to evaluate the operational state of a BIG-IP system.

Administrators upload a QKView file to iHealth to receive an automated assessment of the system. As part of upgrade planning, iHealth provides:

- * Version-specific issue analysis, comparing the system's configuration and hardware against F5's internal catalog of published issues.

* Upgrade advisories, identifying potential risks such as deprecated features, module compatibility concerns, or changes in behavior between TMOS versions.

* Checks against known defects, allowing administrators to determine whether the target TMOS version contains issues relevant to their deployment.

This aligns with F5's recommended upgrade workflow, where iHealth is used before upgrading to confirm system readiness and detect software-level concerns.

D). F5 Bug Tracker

The Bug Tracker is F5's dedicated interface for reviewing software defects across TMOS releases.

It enables administrators to:

* Search for known bugs by TMOS version, module, severity, or defect ID.

* Review the status of defects (open, resolved, fixed in later releases).

* Identify whether high-impact or security-related issues are associated with the target upgrade version.

F5 documentation emphasizes reviewing known defects prior to installation of new software images, making the Bug Tracker a critical resource for upgrade validation.

Why the other options are not correct

A). F5 End User Diagnostics (EUD)

EUD is used exclusively for hardware diagnostics (ports, memory, fans). It does not provide software-related issue verification and is not used for upgrade planning.

C). F5 University

This is a training platform, not an operational tool. It does not provide defect listings or upgrade-specific warnings.

E). F5 Downloads

Although it provides access to software images and release notes, it is not a tool for identifying known bugs.

Release notes summarize general fixes and features, but systematic bug verification requires iHealth or the Bug Tracker.

NEW QUESTION # 31

An organization is planning to upgrade a BIG-IP system from 6.1.x to 7.1.x.

For a successful upgrade, the Service Check Date must be equal to or newer than the License Check Date required for 7.1.x.

Which command will show the Service Check Date on the BIG-IP system being upgraded?

- A. `grep "Service check date" /config/bigip.conf`
- B. `grep "Service check date" /config/svc_chk_date.dat`
- C. `grep "Service check date" /config/bigip.license`
- D. `grep "Service check date" /config/BigDB.dat`

Answer: C

Explanation:

BIG-IP licensing information, including the Service Check Date, is stored in the file:

`/config/bigip.license`

This file contains all license attributes downloaded from the F5 licensing server, including:

- * License key
- * Licensed modules
- * Useful life date
- * Service check date

The Service Check Date determines whether the system is eligible for upgrades to specific TMOS versions.

When reviewing upgrade readiness, administrators extract this value directly from the license file with:

`grep "Service check date" /config/bigip.license`

Why the other options are incorrect:

- * `/config/bigip.conf` stores BIG-IP configuration objects, not license metadata.
- * `/config/svc_chk_date.dat` is not a valid file in the licensing system; it does not contain license parameters.
- * `/config/BigDB.dat` stores internal database values, not licensing attributes.

Thus, only the `bigip.license` file contains the correct licensing information required for verifying upgrade eligibility.

NEW QUESTION # 32

.....

Each user's situation is different. F5CAB1 simulating exam will develop the most suitable learning plan for each user. We will contact the user to ensure that they fully understand the user's situation, including their own level, available learning time on F5CAB1 Training

Questions. Our experts will fully consider the gradual progress of knowledge and create the most effective learning plan on the F5CAB1 exam questions for you.
