CCRN Pediatric Practice Exam Questions and Answers 2024 from AACN

To promote effective grieving in a 6-year-old sibling following the death of an infant, the nurse should:

- A) Recommend that the sibling not attend the infant's memorial service
 - B) Encourage the parents to minimize their expression of grief with the sibling
 - C) Explain to the sibling that the infant went to heaven
 - D) Explain to the sibling that thoughts and wishes did not cause the infant's death - Answer: D) Explain to the sibling that thoughts and wishes did not cause the infant's death: At age 6, children may take words literally and because of their egocentrism, they believe that thoughts are all-powerful. They may truly believe they caused the death of their sibling. A simple, honest explanation of why the sibling died is indicated. This intervention is consistent with Caring Processes.
- A) Recommend that the sibling not attend the infant's memorial service: This intervention is not a solution to the problem and will not promote effective grieving for the sibling. It is not consistent with Caring Processes.
- B) Encourage the parents to minimize their expression of grief with the sibling: This intervention will lead to ineffective grieving for the sibling and is not consistent with Caring Processes
- C) Explain to the sibling that the infant went to heaven: This intervention will not address the sibling's problem

A 5-year-old with a history of congenital hydrocephalus and VP shunt placement at four weeks of age is admitted with increased somnolence, decreased appetite, and increased complaints of headache. This morning the child vomited twice. The nurse should anticipate:

- A) The physician ordering lumbar puncture and blood and urine cultures
 - B) The patient having a CT scan followed by possible shunt revision
 - C) Administering mannitol or hypertonic saline
 - D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx) - Answer: B) The patient having a CT scan followed by possible shunt revision: This patient is demonstrating signs of increased intracranial pressure. The most likely etiology is malfunction of the VP shunt as a result of blockage or disconnection, which is particularly likely over time as the child grows. The definitive diagnosis is made by a CT scan and a shunt series. Surgical intervention for a shunt revision would be indicated.
- A) The physician ordering lumbar puncture and blood and urine cultures: These interventions will not address the most likely primary problem, which is suspected VP shunt malfunction. Additionally, lumbar puncture is contraindicated in the presence of increased intracranial pressure, because downward herniation of the brainstem can occur.
- C) Administering mannitol or hypertonic saline: These medication are indicated for the medical management of increased intracranial pressure, of which this patient has

Sometimes hesitating will lead to missing a lot of opportunities. If you think a lot of our CCRN-Pediatric exam dumps PDF, you should not hesitate again. Too much hesitating will just waste a lot of time. Our CCRN-Pediatric exam dumps PDF can help you prepare casually and pass exam easily. If you make the best use of your time and obtain a useful certification you may get a senior position ahead of others. Chance favors the prepared mind. PassLeaderVCE provide the best CCRN-Pediatric Exam Dumps Pdf

materials in this field which is helpful for you.

AACN Critical Care Nursing Exam Sample Questions (Q135-Q140):

NEW QUESTION # 135

A patient on peritoneal dialysis has high blood glucose. Most likely cause is:

- A. Systemic corticosteroids
- B. Increased glucagon release
- C. Glucose in the dialysate
- D. Decreased pancreatic function

Answer: C

Explanation:

Peritoneal dialysis uses dialysate fluid that contains glucose to create an osmotic gradient for fluid removal.

This glucose can be absorbed into the bloodstream, especially with prolonged dwell times, resulting in hyperglycemia, particularly in pediatric patients with small body mass.

"Glucose in peritoneal dialysis solutions may be systemically absorbed, causing elevated serum glucose levels, particularly in pediatric and insulin-sensitive patients." (Referenced from CCRN Pediatric - Direct Care: Endocrine/Renal, Dialysis Complications)

NEW QUESTION # 136

A school age child is admitted with cancer. The doctor ordered Fentanyl (lollipop) if there is a breakthrough pain. During the teaching on how to use the lollipop, the nurse should state that the client should:

- A. suck it and swallow once pain is relieved.
- B. Place it in the mouth and suck on it until it dissolves.
- C. suck on it for an hour at a time, every 8 hours
- D. hold it in the cheek area until the pain is relieved then remove it.

Answer: D

Explanation:

Explanation: A Fentanyl lozenge or lollipop is absorbed through the buccal mucosa. When pain is relieved, it should be removed and kept until needed again. Remember that there's no specific time to suck on the lozenge

NEW QUESTION # 137

A mother asks the nurse about the immunization schedule for his 15 month-old toddler who is being treated for acute lymphoid leukemia. The nurse responds that the vaccine that is not to be given for a client who is receiving chemotherapy is:

- A. MMR
- B. DtaP
- C. Influenza vaccine
- D. Hepatitis B vaccine

Answer: A

Explanation:

Explanation: MMR vaccine contains a live attenuated virus and is therefore contraindicated for a child who received chemotherapy due to compromised immune system.

NEW QUESTION # 138

A 6-month-old patient presents with bronchiolitis and respiratory distress. Upon admission, the patient has mild retractions, scattered crackles, copious secretions, diarrhea with significant diaper dermatitis, and weight/height/head circumference less than the 5th percentile. The patient's vital signs are:

* BP: 80/45

* HR: 150

* RR: 42

* Temp: 98.8°F (37.1°C)

* SpO#: 96% on 4L heated high flow nasal cannula

A nurse should consider that the patient:

- A. Needs CPAP
- **B. Requires a nutrition assessment**
- C. Needs an arterial blood gas
- D. Requires a wound care consult

Answer: B

Explanation:

This patient demonstrates failure to thrive (FTT) as evidenced by growth parameters below the 5th percentile and signs of malabsorption (diarrhea, dermatitis). While respiratory issues are present, the GI/nutritional status is a critical concern that must be addressed for recovery and long-term health.

"Patients with chronic illness, diarrhea, and poor weight gain should receive early and comprehensive nutritional assessments. Malnutrition exacerbates respiratory disease and delays recovery." (Referenced from CCRN Pediatric - Direct Care: Gastrointestinal and Nutritional Considerations)

NEW QUESTION # 139

The primary function of an institutional ethics committee in the critical care area is to:

- **A. Advise patients, families, physicians, and staff when ethical situations arise**
- B. Monitor questionable physician or staff actions or practices
- C. Establish community partnerships to reduce potential institutional liability
- D. Provide direction to the administrative team for institutional decision-making

Answer: A

Explanation:

Ethics committees are convened to help resolve complex, value-laden clinical issues by offering guidance to care teams and families. These committees are composed of interdisciplinary professionals and focus on supporting ethical decision-making in patient care. "Ethics committees assist healthcare professionals, patients, and families in addressing ethical dilemmas, including end-of-life decisions, treatment refusal, and moral distress." (Referenced from CCRN Pediatric - Professional Caring and Ethical Practice: Ethical Decision-Making Support Structures)

NEW QUESTION # 140

.....

In order to get timely assistance when you encounter problems, our staff will be online 24 hours a day.
