Salesforce Certified MuleSoft Developer II Sample Questions (Q14-Q19):

NEW QUESTION # 14

A Mule application for processing orders must log the order ID for every log message output.

What is a best practice to enrich every log message with the order ID?

- A. Use flow variables within every logger processor to log the order ID
- B. Set a flow variable and edit the log4/2.xml file to output the variable as part of the message pattern
- C. Create a custom XML SDK component to wrap the logger processor and automatically add the order ID within the connector
- D. Use the Tracing module to set logging variables with a Mapped Diagnostic Context

Answer: D

Explanation:

To enrich every log message with the order ID, the developer should use the Tracing module to set logging variables with a Mapped Diagnostic Context (MDC). The Tracing module allows adding custom key-value pairs to log messages using MDC variables. The developer can use Set Logging Variables operation to set the order ID as an MDC variable and then use it in any logger processor

within the same thread or event. Reference: <https://docs.mulesoft.com/tracing-module/1.0/tracing-module-reference#set-logging-variables>

NEW QUESTION # 15

A Mule implementation uses a HTTP Request within an Unit Successful scope to connect to an API.

How should a permanent error response like HTTP:UNAUTHORIZED be handle inside Until Successful to reduce latency?

- A. Put the HTTP Request inside a try scope in Unit Successful.
In the error handler, use On Error Propagate to catch permanent errors like HTTP UNAUTHORIZED.
- B. In Until Successful configuration, set the retry count to 1 for error type HTTP: UNAUTHORIZED.
- C. Configure retrying until a MULERETRY_EXHAUSTED error is raised or the API responds back with a successful response.
- **D. Put the HTTP Request inside a try scope in Unit Successful.
In the error handler, use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED.**

Answer: D

Explanation:

To handle a permanent error response like HTTP:UNAUTHORIZED inside Until Successful, the developer should put the HTTP Request inside a try scope in Unit Successful, and use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED in the error handler. This way, the developer can avoid retrying requests that will always fail due to a permanent error, and reduce latency. On Error Continue allows the flow to continue processing after handling the error. Reference:

NEW QUESTION # 16

Multiple individual Mule application need to use the Mule Maven plugin to deploy to CloudHub.

The plugin configuration should .. reused where necessary and anything project, specific should be property-based.

Where should the Mule Maven details be configured?

- A. Settings, xml
- B. A Bill of Materials (BOM) parent pm
- C. Pom, xml
- **D. A parent pom.xml**

Answer: D

Explanation:

To reuse Mule Maven plugin configuration across multiple individual Mule applications, the developer should use a parent pom.xml file. A parent pom.xml file defines common configuration for one or more child projects that inherit from it. The developer can specify common properties and dependencies for all child projects in the parent pom.xml file, such as Mule Maven plugin configuration, and then reference them in each child project's pom.xml file using placeholders. Reference:

<https://docs.mulesoft.com/mule-runtime/4.3/mmp-concept#parent-pom> https://maven.apache.org/guides/introduction/introduction-to-the-pom.html#Project_Inheritance

NEW QUESTION # 17

Which properties are mandatory on the HTTP Connector configuration in order to use the OAuth 2.0 Authorization Code grant type for authentication?

- A. External callback URL, access token URL, client ID, response refresh token
- B. Token URL, authorization URL, client ID, client secret local callback URL
- **C. External callback URL, access token URL, local authorization URL, authorization URL, client ID, client secret**
- D. External callback URL, access token URL, client ID response access token

Answer: C

Explanation:

To use the OAuth 2.0 Authorization Code grant type for authentication, the HTTP Connector configuration requires the following

properties: token URL, authorization URL, client ID, client secret, and local callback URL. The token URL is the endpoint of the authorization server that provides access tokens. The authorization URL is the endpoint of the authorization server that initiates the user consent flow. The client ID and client secret are the credentials of the Mule application registered with the authorization server. The local callback URL is the endpoint of the Mule application that receives the authorization code from the authorization server. Reference: <https://docs.mulesoft.com/http-connector/1.6/http-authentication#oauth-2-0>

NEW QUESTION # 18

A healthcare customer wants to use hospital system data, which includes code that was developed using legacy tools and methods. The customer has created reusable Java libraries in order to read the data from the system. What is the most effective way to develop an API retrieve the data from the hospital system?

- A. Refer to JAR files in the code
- B. Create the Java code in your project and invoice the data from the code
- C. Include the libraries writes deploying the code into the runtime
- **D. Install libraries in a local repository and refer to it in the pm.xml file**

Answer: D

Explanation:

To develop an API that retrieves data from a hospital system using reusable Java libraries, the developer should install libraries in a local repository and refer to it in the pom.xml file. This way, the developer can use Maven to manage dependencies and invoke Java code from Mule applications using Java Module operations. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/java-module-reference#add-the-java-module-to-your-project> <https://docs.mulesoft.com/mule-runtime/4.3/java-module-reference#invoke-java-code>
