NEW QUESTION # 537

A developer is building an application to access a website. When running the application, an HTTP 403 error code has been received.

How should the application be modified to handle this code?

- A. Use exponential backoff when retrying distributed services and other remote endpoints.
- B. Redirect the request to an internal web server and make a new request from the internal resource.
- C. Build a try/except around the urlopen to find errors occurring in the request.
- D. Create a loop on cancel the operation and run a new one after the code is received.

Answer: C

Explanation:

403 Forbidden: You are authenticated and authorized but do not have the permission to access the resource.

NEW QUESTION # 538

A developer must package an application for Kubernetes to integrate into a prebuilt CD environment. The application utilizes a Docker image from Cisco DevNet public repository and is accessible from a specific port of the container. Drag and drop the code from the bottom onto the box where the code is missing in the Kubernetes YAML configuration file. Not all options are used.

The screenshot shows a Kubernetes YAML configuration editor. The main area contains a YAML snippet for a StatefulSet. There are several empty text boxes for input. At the bottom, there are four draggable boxes: 'type', 'spec', 'kind', and 'image'. The 'image' box is highlighted in yellow. A large 'Cisco' logo is visible in the background.

```
