EMC Dell PowerEdge Foundations v2 Exam Sample Questions (Q87-Q92):

NEW QUESTION # 87

A system administrator is setting up a new PowerEdge server and must decide between using an HBA or a PERC card for storage connectivity. The primary requirement is highspeed data transfer to network devices, and cost is a significant constraint. Which approach should the administrator prioritize for initial setup?

- A. Integrate a PERC card to enable future RAID configurations for data redundancy
- B. Choose a RAID controller due to its inherent ability to manage a greater number of devices efficiently
- C. Implement a PERC card to immediately reduce latency and enhance overall storage performance
- **D. Select an HBA card for cost-effective, reliable non-RAID I/O operations**

Answer: D

NEW QUESTION # 88

A software development team must set up a testing environment where they can run multiple operating systems on their existing workstations without altering their primary OS. Which type of hypervisor is suitable for this team, allowing them to access virtualization services through their current operating system, rather than directly on the hardware?

- A. Implement a bare metal hypervisor for direct hardware access.
- B. Deploy a Type 1 hypervisor to bypass the existing OS.
- C. Choose Microsoft Hyper-V for its standalone OS capabilities.
- **D. Utilize a hosted hypervisor that works through a host OS.**

Answer: D

Explanation:

A hosted hypervisor (Type 2) runs on top of an existing operating system, allowing virtualization services to be accessed through the host OS without modifying the primary system or requiring direct hardware control.

This is ideal for testing multiple OS on workstations, as it leverages the host for resource management. Type 1 hypervisors (bare metal) install directly on hardware, bypassing the OS, which would alter the setup.

Microsoft Hyper-V can operate as Type 1 in standalone mode. This approach suits development environments needing flexibility without hardware dedication. Exact extract: "Explain Hypervisors and virtual machines..."

Explain how different PowerEdge server models are better suited for specific roles." Reference: Dell PowerEdge Foundations v2 Exam Description (D-PE-FN-01), Topic: Server Architecture and Roles (22%).

NEW QUESTION # 89

An administrator is tasked with updating firmware on several remote servers without interrupting the operating system. Which method should they use?

- **A. Utilize iDRAC**
- B. Set up System Setup
- C. Clone the OS configuration
- D. Implement OpenManage Enterprise

Answer: A

Explanation:

The Integrated Dell Remote Access Controller (iDRAC) allows administrators to update firmware on PowerEdge servers remotely without interrupting the operating system. iDRAC's out-of-band management enables firmware updates via its web interface or CLI, ensuring minimal disruption. OpenManage Enterprise requires additional software and is for broader management, System Setup requires local access and may interrupt operations, and cloning OS configuration is unrelated to firmware updates. iDRAC is the most efficient method for remote, non-disruptive updates. Exact extract: "Describe different methods of updating firmware and drivers in PowerEdge Servers... Compare the PowerEdge Servers management applications, utilities, and licensing." Reference: Dell PowerEdge Foundations v2 Exam Description (D-PE-FN-01), Topic: Maintenance (18%).

NEW QUESTION # 90

For what purpose and at which boot prompt should the F2 key be pressed when starting a PowerEdge server?

- A. For diagnostic utilities during system startup
- **B. To enter System Setup when prompted on the boot screen**
- C. To access Boot Manager during warm boot
- D. To launch Lifecycle Controller on warm reboot

Answer: B

NEW QUESTION # 91

Power supply unit 2 (PSU 2) on a Dell PowerEdge R760 server has been losing power several times a day.

The system administrator is planning to replace the power supply but is unsure which power supply is referenced as PSU 2. What is the most reliable way for the system administrator to visually identify PSU 2?

- **A. Check the chassis label near the power supplies for PSU numbers**
- B. Look for a constant amber LED on PSU 1, indicating a problem with that unit
- C. Use the iDRAC web UI to activate the blink option for PSU 2's LED
- D. Assume PSU 2's LEDs are off because the iDRAC has disabled it

Answer: A

Explanation:

The most reliable way to identify PSU 2 on a PowerEdge R760 is to check the chassis label near the power supplies, which clearly marks PSU numbers for accurate identification. This physical label ensures certainty without assumptions. Using iDRAC to blink

LEDs is useful but less direct, assuming LEDs are off is unreliable, and checking PSU 1's LED does not identify PSU 2. Exact extract: "Describe maintenance functions, shutdowns, reboots of a PowerEdge Server... Explain the power distribution considerations." Reference: Dell PowerEdge Foundations v2 Exam Description (D-PE-FN-01), Topic: Maintenance (18%).
