## Questions (Q52-Q57):

### NEW QUESTION # 52

Universal Containers allows customers to log into a Salesforce Community and update their orders via a custom Visualforce page. Universal Containers' sales representatives can edit the orders on the same Visualforce page.

What should a developer use in an Apex test class to test that record sharing is enforced on the Visualforce page?

- A. use `System.runAs()` to test as an administrator and a community user.
- B. use `System.profilesId=()` to test as a sales rep and a community user.
- C. use `System.profiles=()` to test as a sales rep and a community user.
- D. use `System.profiles()` to test as an administrator and a community user.

**Answer: A**

Explanation:

The `System.runAs()` method is used in test classes to enforce record sharing. This method allows you to write test methods that change user contexts to ensure that the proper record sharing is enforced. Reference:

### NEW QUESTION # 53

What is the best practice to initialize a Visualforce page in a test class?

- A. Use `Test.setCurrentPage(Page.MyTestPage);`
- B. Use `Test.setCurrentPage(MyTestPage);`
- C. Use `controller.currentPage.setPage(MyTestPage);`
- D. Use `Test.currentPage.getParamaters put(MyTestPage);`

**Answer: A**

Explanation:

`Test.setCurrentPage(Page.MyTestPage)` is used to set the context to a Visualforce page in tests, allowing you to simulate a page request in a test method.

### NEW QUESTION # 54

A company has an Apex process that makes multiple extensive database operations and web service callouts. The database processes and web services can take a long time to run and must be run sequentially.

How should the developer write this Apex code without running into governor limits and system limitations?

- A. Use multiple `execute` methods for each process and callout.
- B. Use Apex Scheduler to schedule each process.
- C. Use **Queueable Apex to chain the jobs to run sequentially.**
- D. Use Limits class to stop entire process once governor limits are reached.

**Answer: C**

Explanation:

Queueable Apex is suitable for complex processes that require chaining jobs to run sequentially. It can handle long-running processes without hitting governor limits, as each chained job runs in a new transaction with its own set of governor limits.

### NEW QUESTION # 55

Universal Containers decided to use Salesforce to manage a new hire interview process. A custom object called Candidate was created with organization-wide defaults set to Private. A lookup on the Candidate object sets an employee as an Interviewer.

What should be used to automatically give Read access to the record when the lookup field is set to the Interviewer user?

- A. The record can be shared using an Apex class.
- B. **The record can be shared using a sharing rule.**
- C. The record can be shared using a permission set.
- D. The record cannot be shared with the current setup.

**Answer: B**

Explanation:

A sharing rule can be used to automatically give Read access to a user specified in a lookup field. Sharing rules are declarative and can be based on criteria such as the value of a lookup field. This can be done without writing code and is maintainable through the Salesforce UI.

#### NEW QUESTION # 56

As part of a custom interface, a developer team creates various new Lightning web components. Each of the components handles errors using toast messages. When the development is complete, all the components are added to the same Lightning page. During acceptance testing, users complain about the long chain of toast messages that display when errors occur loading the components.

Which two techniques should the developer implement to improve the user experience?

Choose 2 answers

- A. Use the `window.alert()` method to display the error messages
- **B. Use public, properties on each component to display the error messages.**
- C. Use a `<template>` tag to display in-place error messages.
- **D. Use a Lightning web component to aggregate and display all errors**

**Answer: B,D**

Explanation:

The scenario describes a common issue when multiple components are used on the same Lightning page and each component manages its error handling independently, leading to a "long chain of toast messages" which can be overwhelming for users.

To improve user experience, the developers can implement the following techniques:

A . Use a Lightning web component to aggregate and display all errors: This method involves creating a centralized component responsible for handling all error messages. This component would receive error notifications from other components and then display them in a user-friendly manner. The benefit of this approach is that it provides a single, consistent interface for error messages, reducing the clutter and confusion that can be caused by multiple toasts.

D . Use public properties on each component to display the error messages: By using public properties, components can expose their error states to a parent or orchestrating component, which can then display these errors in a single, consolidated way. This avoids the issue of multiple toast notifications and allows for a more integrated error handling experience.

The other options presented are less ideal:

B . Using the `window.alert()` method is not recommended in a professional Salesforce environment as it is considered a disruptive way to show errors and does not align with the Salesforce Lightning design system.

C . Using a `<template>` tag to display in-place error messages could be a viable option for displaying error messages within the component itself, but it does not address the issue of multiple errors stacking up from different components as described in the scenario.
