Peoplecert PeopleCert DevOps Site Reliability Engineer (SRE) Sample Questions (Q76-Q81):

NEW QUESTION # 76

Which of the following BEST describes an advantage of a container-based structure?

- A. The portability created by containers enables software to run independently of the host operating system
- B. The security of applications in containers is simplified because they share the security of the host system
- C. The lightweight nature of containers requires fewer developers to actually create the software code
- D. Software runs much more efficiently in containers because of the ability to run on virtual machines

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Containers provide a major advantage that aligns with SRE: portability and environment consistency. The SRE Workbook describes containers as: "lightweight, portable units that encapsulate applications and dependencies, ensuring consistent behavior across environments." This independence from the host OS environment enables predictable deployments and simplifies automation, scaling, and orchestration- especially when used with Kubernetes.

Option A captures this exact benefit: portability and independence from the host OS.

Option B is incorrect-containers do not reduce the number of developers required.

Option C incorrectly claims that efficiency comes from virtual machines; containers are typically more efficient because they avoid VM overhead, not leverage it.

Option D is incorrect-containers do not "inherit" security automatically; in fact, they require additional security controls.

Thus, A is the correct answer.

NEW QUESTION # 77

The value of data-driven measurements can be MOST accurately explained by which of the following?

- A. Objectives can only be appropriately designed when based upon actual data
- B. Data mining enables an organization to determine the legitimacy of all metrics
- C. The gathering of data will provide all the necessary facts to enable better decisions
- D. An analysis and understanding of data helps to ensure fact-based decision-making

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

SRE emphasizes decision-making based on measured data, not intuition. The SRE Book explains:

"Monitoring and SLOs provide an objective basis for decision-making, replacing guesswork with quantifiable data." (SRE Book - SLOs & Monitoring). Data enables SRE teams to understand system behavior, validate assumptions, detect anomalies, and prioritize engineering work. The primary benefit is not merely collecting data, but analyzing and interpreting it to support decisions grounded in facts rather than opinion.

Option A accurately reflects this principle: data analysis and interpretation enable fact-based decisions, which is the core justification for SRE's reliance on SLIs and observability signals.

Option B overstates by claiming data alone is always sufficient.

Option C refers to data mining, which is not a core SRE concept.

Option D is partially true but narrower than the SRE philosophy of data-driven operations.

Thus, A is the most accurate SRE-aligned answer.

NEW QUESTION # 78

When applied to service levels, the principle of decreasing marginal productivity can be represented in three stages. Which of the following is NOT one of these stages?

- A. Negative returns
- B. increasing returns
- C. Possible returns
- D. Diminishing returns

Answer: C

NEW QUESTION # 79

What is the goal of SRE?

- A. To create highly reliable post-deployment operational systems that align with DevOps and Agile
- B. To ensure that Service Level Objectives are consistently met through monitoring and observability
- **C. To create ultra-scalable and highly reliable distributed software systems**
- D. To spend 50% of a SRE's time on operational tasks and 50% of the time on development tasks to reduce toil

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The goal of Site Reliability Engineering (SRE) is to create ultra-scalable and highly reliable distributed software systems. This principle is clearly articulated in the foundational text of SRE, the Google Site Reliability Engineering book.

From Chapter 1: Introduction of the Site Reliability Engineering book:

"SRE is what happens when you ask a software engineer to design an operations team. Our approach to service management is rooted in our belief that engineering work to create scalable and highly reliable systems is critical to the success of modern software."

- Site Reliability Engineering Book, Chapter 1

This statement establishes that building and maintaining scalable, reliable systems is the core mission of SRE.

While concepts like reducing toil (option A), implementing SLOs (option B), and aligning with DevOps (option C) are vital components of the SRE practice, they support the overarching goal - which is option D.

Therefore, the correct answer is D: To create ultra-scalable and highly reliable distributed software systems.

NEW QUESTION # 80

Which scenario BEST illustrates the swarming concept used during incident management?

- A. An incident analyst rote escalates by assessing a consolidated list of next-level support teams and their area of expertise
- **B. A group of specialist teams meet and review a queue of escalated incidents to determine who should work on which one**
- C. A high-level specialist support team constantly reviews their incoming incident queue to respond instantly to escalations
- D. A mid-level support team continually monitors escalated incidents to assigned teams to ensure they are making progress

Answer: B
