To be eligible to take the CISSP exam, candidates are required to have a minimum of five years of professional experience in information security. However, candidates with less than five years of experience can still take the exam and become an Associate of (ISC)² until they meet the experience requirements.

ISC CISSP (Certified Information Systems Security Professional) exam is one of the most highly regarded certifications in the field of cybersecurity. CISSP exam is designed to test the knowledge and skills of professionals who are responsible for designing, implementing, and managing information security programs in their organizations. The CISSP certification is recognized globally and is highly valued by employers, making it a highly sought-after certification among cybersecurity professionals.

How to earn PCSA credentials?

The candidate must earn 50 continuing education units (CEUs) for the PCSA credential. The CEUs may be earned through participation in the ISSA - ISC2 Security Forum of Interest Community of Interest (COI), attendance at an Information Systems Security Association (ISSA) certified training course, obtaining CEUs from any other Information Systems Security Association or Information Systems Audit and Control Association (ISACA) member, obtaining certification credits for passing the exam, or through participating in many other online sites.The Professional level requires passing two exams to achieve. The PCSA credential is defined as conforming to the requirements of NCEES, the American Society for Testing and Materials (ASTM), and the International Information Systems Security Certification Consortium (ISC). The test will not earn a CISSP valid certification.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q734-Q739):

NEW QUESTION # 734
Controls are implemented to:

- A. mitigate risk and reduce the potential for loss
- B. eliminate risk and eliminate the potential for loss
- C. mitigate risk and eliminate the potential for loss
- D. eliminate risk and reduce potential for loss

Answer: A

NEW QUESTION # 735
Compared to a traditional network, which of the following is a security-related benefit that software- defined networking (SDN) provides?

- A. Reduced hardware footprint and cost
- B. Centralized network administrator control
- C. Centralized network provisioning
- D. Reduced network latency when scaled

Answer: B

Explanation:
Centralized network administrative control - interestingly, this option is a strength and weakness for SDN. Although you can provide defence of depth controls on the SDN controller but compromising the admin account can initiate various types of attacks on SDN. but this option seems right compared to others.

NEW QUESTION # 736
Which of the following is TRUE for an organization that is using a third-party federated identity service?

- A. The organization defines internal standard for overall user identification
- B. The organization enforces the rules to other organization's user provisioning
- C. The organization specifies alone how to authenticate other organization's users
- D. The organization establishes a trust relationship with the other organizations

Answer: D

Explanation:
The true statement for an organization that is using a third-party federated identity service is that the organization establishes a trust relationship with the other organizations. A federated identity service is a service that enables users to access multiple applications or systems across different domains or organizations using a single identity and authentication method. A federated identity service relies on a trust relationship between the identity provider (IdP), which is the organization that issues and manages the user's identity, and the service provider (SP), which is the organization that provides the application or system that the user wants to access. The trust relationship is established by using standards and protocols, such as SAML, OAuth, or OpenID Connect, that enable the exchange of identity and authentication information between the IdP and the SP. The other options are not true for an organization that is using a third-party federated identity service. The organization does not enforce the rules to other organization's user provisioning, as the user provisioning is the responsibility of the IdP, not the SP. The organization does not define internal standard for overall user identification, as the user identification is based on the standard and protocol agreed upon by the IdP and the SP. The organization does not specify alone how to authenticate other organization's users, as the authentication is performed by the IdP, not the SP. NEW QUESTION # 737

The RSA Algorithm uses which mathematical concept as the basis of its encryption?

- A. 16-round ciphers
- B. PI (3.14159...)
- C. Geometry
- D. Two large prime numbers

Answer: D

Explanation:
Explanation/Reference:
Explanation:
RSA is derived from the last names of its inventors, Rivest, Shamir, and Addleman.
This algorithm is based on the difficulty of factoring a number, N, which is the product of two large prime numbers. These numbers may be 200 digits each. Thus, the difficulty in obtaining the private key from the public key is a hard, one-way function that is equivalent to the difficulty of finding the prime factors of N.
In RSA, public and private keys are generated as follows:
Choose two large prime numbers, p and q, of equal length, compute p3q 5 n, which is the public
modulus.
Choose a random public key, e, so that e and (p - 1)(q - 1) are relatively prime.
Compute e x d = 1 mod (p - 1)(q - 1), where d is the private key.
Thus, d = e-1 mod [(p - 1)(q - 1)]
From these calculations, (d, n) is the private key and (e, n) is the public key.
Incorrect Answers:
A: The RSA Algorithm does not use Geometry as the basis of its encryption.
B: The RSA Algorithm does not use 16-round ciphers as the basis of its encryption.
C: The RSA Algorithm does not use PI as the basis of its encryption.
