More and more people look forward to getting the Deep-Security-Professional certification by taking an exam. However, the exam is very difficult for a lot of people. Especially if you do not choose the correct study materials and find a suitable way, it will be more difficult for you to pass the exam and get the Deep-Security-Professional related certification. If you want to get the related certification in an efficient method, please choose the Deep-Security-Professional Study Materials from our company. We can guarantee that the study materials from our company will help you pass the exam and get the certification in a relaxed and efficient method.

The Trend Micro Certified Professional for Deep Security certification exam consists of 60 multiple-choice questions that cover various topics related to Trend Micro Deep Security, including installation and deployment, policy configuration, system administration, and troubleshooting. Candidates have 90 minutes to complete the exam, and they must achieve a passing score of 70% or higher to earn the certification. Deep-Security-Professional Exam is available in English, Japanese, and Simplified Chinese.

The Trend Deep-Security-Professional desktop-based practice exam software is beneficial for you to evaluate and enhance your knowledge before taking the Trend Micro Certified Professional for Deep Security Exam Questions. All of the features of our online Deep-Security-Professional Practice Test software are included in our desktop windows-based Trend Deep-Security-Professional practice exam software.

Trend Micro Certified Professional for Deep Security Sample Questions (Q80-Q85):

NEW QUESTION # 80

Policies in Deep Security can include a Context value. Which of the following statements re-garding Context is correct?

- A. The Context provides Deep Security Agents with location awareness and are associated with Log Inspection and Integrity Monitoring Rules.
- **B. The Context provides Deep Security Agents with location awareness and are associated with Firewall and Intrusion Prevention Rules.**
- C. The Context provides Deep Security Agents with location awareness and are associated with Anti-Malware and Web Reputation Rules.
- D. The Context provides Deep Security Agents with location awareness and are associated with Web Reputation Rules only.

Answer: B

Explanation:

Contexts are designed to be associated with Firewall and Intrusion Prevention Rules. If the conditions defined in the Context associated with a rule are met, the rule is applied. To link a security rule to a Context, go to the Options tab in the Properties window for the rule and select the Context from the menu.

NEW QUESTION # 81

Your VMware environment is configured without using NSX. How can Deep Security provide protection to the virtual images hosted on your ESXi servers?

- **A. Without NSX, a Deep Security Agent must be installed on each virtual machine hosted on the ESXi server.**
- B. You can install a Deep Security Virtual Appliance on the ESXi server. This will provide agentless support for Anti-Malware, Intrusion Prevention, Integrity Monitoring, Firewall and Web Reputation.
- C. Without NSX, you can only enable Anti-Malware and Integrity Monitoring protection on the virtual machines. NSX is required to support Intrusion Prevention, Firewall and Web Reputation
- D. Without NSX, you will be unable to use Deep Security to protect your virtual machines.

Answer: A

Explanation:

In a VMware environment without NSX, agent-based protection is required. This means that the Deep Security Agent must be installed individually on each VM to provide protection. Agentless protection via the Virtual Appliance is only available in environments integrated with NSX.

NEW QUESTION # 82

A Recommendation Scan is run to determine which Intrusion Prevention rules are appropriate for a Server.

The scan is configured to apply the suggested rules automatically and ongoing scans are enabled. Some time later, an operating system patch is applied. How can you determine which Intrusion Prevention rules are no longer needed on this Server?

- A. The README file provided with the software patch will indicate which issues were addressed with this release. Compare this list to the rules that are applied to determine which rules are no longer needed and can be disabled.
- B. Since the rules are being applied automatically, when the next Intrusion Prevention Recommendation Scan is run

automatically, any rules that are no longer needed will be automatically unassigned. These are rules that are no longer needed as the vulnerability was corrected with the patch.

- C. Since there is no performance effect when multiple Intrusion Prevention rules are applied, there is no need to determine which rules are no longer needed. The original recommended rules can remain in place without affecting the system.
- D. Since the rules are being applied automatically, when the next Intrusion Prevention Recommendation Scan is run automatically, any rules that are no longer needed will be displayed on the Recommended for Unassignment tab in the IPS Rules. These are rules that are no longer needed and can be disabled as the vulnerability was corrected with the patch.

Answer: C

Explanation:

When ongoing Recommendation Scans are enabled, Deep Security regularly reassesses the server's vulnerabilities based on its current patch level. If an OS patch addresses a previously detected vulnerability, the next Recommendation Scan will recognize this and recommend that the now-unnecessary IPS rules be unassigned. These rules appear in the "Recommended for Unassignment" tab, making it easy for administrators to review and unassign rules that are no longer needed.

From the official documentation:

"After an operating system or application is patched, running another Recommendation Scan will update the list of vulnerabilities and may move some IPS rules to the 'Recommended for Unassignment' tab. These rules can then be reviewed and unassigned to maintain optimal protection." Option B is incorrect because rules are not unassigned automatically; admin review is required. Option A is manual and outside Deep Security's automated workflow.

The first option C is not correct; excessive rules may impact performance and management.

NEW QUESTION # 83

Which of the following statements is false regarding Firewall rules using the Bypass action?

- A. Firewall rules using the Bypass action allow incoming traffic to skip both Firewall and Intrusion Prevention analysis.
- B. Firewall rules using the Bypass action can be optimized, allowing traffic to flow as efficiently as if a Deep Security Agent was not there.
- C. Applying a Firewall rule using the Bypass action to traffic in one direction automatically applies the same action to traffic in the other direction.
- D. Firewall rules using the Bypass action do not generate log events.

Answer: C

Explanation:

Firewall rules using Bypass have the following noteworthy characteristics:

* Bypass skips both Firewall and Intrusion Prevention analysis.

* Since stateful inspection is for bypassed traffic, bypassing traffic in one direction does not automatically bypass the response in the other direction. As a result firewall rules using Bypass are always created in pairs, one for incoming traffic and another for outgoing.

* Firewall rules using Bypass will not be logged. This is not a configurable behavior.

* Some firewall rules using Bypass are optimized, in that traffic will flow as efficiently as if the Deep Security Agent/Deep Security Virtual Appliance was not there.

NEW QUESTION # 84

How is caching used by the Web Reputation Protection Module?

- A. Caching is used by the Web Reputation Protection Module to keep track of Allowed and Blocked Web sites. Any sites that are Allowed or Blocked do not require the retrieval of a credibility score from the Trend Micro Web Reputation Service.
- B. Caching is used by the Web Reputation Protection Module to temporarily store the pages that make up the Web site. The Web site is cached in case the site is visited again for the life of the cache.
- C. Caching is used by the Web Reputation Protection Module to keep track of Web sites that are added to the Allowed list. Any sites added to the Allowed list will be accessible by protected servers regardless of their credibility score.
- D. Caching is used by the Web Reputation Protection Module to temporarily store the credibility score for a Web site. The retrieved credibility score is cached in case the score for the Web site is required again for the life of the cache.

Answer: D

NEW QUESTION # 85

.....

If you want to ace the Trend Micro Certified Professional for Deep Security (Deep-Security-Professional) test, the main problem you may face is not finding updated Deep-Security-Professional practice questions to crack this test quickly. After examining the situation, the BraindumpsVCE has come with the idea to provide you with updated and actual Trend Deep-Security-Professional Exam Dumps so you can pass Trend Micro Certified Professional for Deep Security (Deep-Security-Professional) test on the first attempt. The product of BraindumpsVCE has many different premium features that help you use this product with ease. The study material has been made and updated after consulting with a lot of professionals and getting customers' reviews.
