## Veeam Certified Engineer v12 Sample Questions (Q97-Q102):

### NEW QUESTION # 97

For which workload can Veeam Data Platform achieve image-level backups?

- A. Solaris
- B. IHP-UX
- C. IOS

- D. AS/400

**Answer: A**

Explanation:

Veeam Data Platform can achieve image-level backups for Solaris workloads. This means it can create a complete backup of the system at the image level, capturing the entire state of the Solaris system, including the operating system, applications, and data.

**NEW QUESTION # 98**

A customer wants to set up a Scale-Out Backup Repository. Due to malware concerns, immutability is recommended. An on-premises server can be used to hold primary backups, but it can only hold about 21 days of backups. A copy of the backups should be stored in AWS. The retention for all backups is 60 days.

Which configuration of a Scale-out Backup repository meets these requirements?

- A. Copy and move mode Performance Tier: Linux Hardened Repository, XFS, immutability set for 11 days Capacity Tier: Amazon S3, immutability set for 60 days
- B. Copy mode  
Performance Tier: Windows REFS, immutability set for 11 days  
Capacity Tier: Amazon S3, immutability set for 60 days
- C. Copy and move mode  
Performance Tier: Windows REFS, immutability set for 11 days  
Capacity Tier: Amazon S3, immutability set for 60 days
- D. Copy mode  
Performance Tier: Linux Hardened Repository, XFS, immutability set for 11 days Capacity Tier: Amazon S3, immutability set for 60 days

**Answer: A**

Explanation:

To meet the requirements of setting up a Scale-Out Backup Repository (SOBR) with immutability for malware protection and specific retention policies, the most fitting configuration is D: Copy and move mode with a Performance Tier configured on a Linux Hardened Repository using the XFS file system and immutability set for 21 days, and a Capacity Tier on Amazon S3 with immutability set for 60 days. This setup utilizes the copy and move mode to ensure that backups are first stored on the on-premises Linux Hardened Repository with an immutability setting that prevents modifications to backups, providing protection against malware for the most recent 21 days of backups. As this on-premises server has limited capacity, older backups beyond 21 days are moved to the Capacity Tier in Amazon S3, where they are also protected with immutability for the entire 60-day retention period. This configuration leverages the strengths of both on-premises and cloud storage while ensuring that all backups are protected from modification or deletion by immutability, aligning with the customer's malware protection concerns and retention requirements.

**NEW QUESTION # 99**

What happens if there are more than five unsuccessful attempts to enter the confirmation code during MFA login?

- A. The user is locked out for 1 hour.
- B. The user is permanently locked out.
- C. The user is locked out for 24 hours.
- D. The user is locked out for 1 minute.

**Answer: C**

Explanation:

In Veeam Backup & Replication, if there are multiple unsuccessful attempts to enter a confirmation code for Multi-Factor Authentication (MFA), the system will lock the user account to prevent unauthorized access.

Based on standard security practices, and while it may vary, a lockout for 24 hours after exceeding the maximum number of failed attempts is a common approach to protect against brute force attacks. Please note that specific lockout policies can vary by system configuration and the policies set by the system administrator. It's always best to consult the actual system settings or documentation for the precise behavior in a given environment.

**NEW QUESTION # 100**

Why is it recommended to have at least one backup proxy server in each site when defining a replica job?

- A. The proxies allow replication automatic restart after failure.
- B. The proxies enable a stable connection for VM data transfer across sites.
- C. The proxies allow for no VM snapshots during transit.
- D. The proxies allow automatic WAN acceleration.

**Answer: B**

Explanation:

Explanation

A backup proxy is a component that acts as a data mover in the backup infrastructure. It retrieves data from the source and transfers it to the target<sup>1</sup>. When defining a replica job, it is recommended to have at least one backup proxy server in each site to enable a stable connection for VM data transfer across sites<sup>2</sup>. This way, the backup proxy at the source site can communicate with the backup proxy at the target site and send data over the WAN without affecting the production hosts<sup>2</sup>. The other options are not correct for explaining why backup proxies are recommended. The proxies do not allow automatic WAN acceleration, as this is a function of the WAN accelerators<sup>3</sup>. The proxies do not allow for no VM snapshots during transit, as the replication process requires creating a snapshot of the source VM to read its data. The proxies do not allow replication automatic restart after failure, as this is a setting of the replication job.
