## Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q226-Q231):

### NEW QUESTION # 226

A development team is collaborating with another company to create an integrated product. The other company needs to access an Amazon Simple Queue Service (Amazon SQS) queue that is contained in the development team's account. The other company wants to poll the queue without giving up its own account permissions to do so.

How should a solutions architect provide access to the SQS queue?

- A. Create an instance profile that provides the other company access to the SQS queue.
- B. Create an IAM policy that provides the other company access to the SQS queue.
- C. Create an Amazon Simple Notification Service (Amazon SNS) access policy that provides the other company access to the SQS queue.
- **D. Create an SQS access policy that provides the other company access to the SQS queue.**

**Answer: D**

Explanation:

To provide access to the SQS queue to the other company without giving up its own account permissions, a solutions architect should create an SQS access policy that provides the other company access to the SQS queue. An SQS access policy is a resource-based policy that defines who can access the queue and what actions they can perform. The policy can specify the AWS account ID of the other company as a principal, and grant permissions for actions such as `sqs:ReceiveMessage`, `sqs:DeleteMessage`, and `sqs:GetQueueAttributes`. This way, the other company can poll the queue using its own credentials, without needing to assume a

role or use cross-account access keys. Reference:  
Using identity-based policies (IAM policies) for Amazon SQS  
Using custom policies with the Amazon SQS access policy language

#### NEW QUESTION # 227

A media company collects and analyzes user activity data on premises. The company wants to migrate this capability to AWS. The user activity data store will continue to grow and will be petabytes in size. The company needs to build a highly available data ingestion solution that facilitates on-demand analytics of existing data and new data with SQL. Which solution will meet these requirements with the LEAST operational overhead?

- A. Place activity data in an Amazon S3 bucket. Configure Amazon S3 to run an AWS Lambda function on the data as the data arrives in the S3 bucket.
- **B. Send activity data to an Amazon Kinesis Data Firehose delivery stream. Configure the stream to deliver the data to an Amazon Redshift cluster.**
- C. Create an ingestion service on Amazon EC2 instances that are spread across multiple Availability Zones. Configure the service to forward data to an Amazon RDS Multi-AZ database.
- D. Send activity data to an Amazon Kinesis data stream. Configure the stream to deliver the data to an Amazon S3 bucket.

**Answer: B**

Explanation:

Amazon Redshift is a fully managed, petabyte-scale data warehouse service in the cloud. You can start with just a few hundred gigabytes of data and scale to a petabyte or more. This allows you to use your data to gain new insights for your business and customers. The first step to create a data warehouse is to launch a set of nodes, called an Amazon Redshift cluster. After you provision your cluster, you can upload your data set and then perform data analysis queries. Regardless of the size of the data set, Amazon Redshift offers fast query performance using the same SQL-based tools and business intelligence applications that you use today.

#### NEW QUESTION # 228

A company wants to measure the effectiveness of its recent marketing campaigns. The company performs batch processing on csv files of sales data and stores the results in an Amazon S3 bucket once every hour. The S3 bucket contains petabytes of objects. The company runs one-time queries in Amazon Athena to determine which products are most popular on a particular date for a particular region. Queries sometimes fail or take longer than expected to finish. Which actions should a solutions architect take to improve the query performance and reliability? (Select TWO.)

- **A. Use an AWS Glue extract, transform, and load (ETL) process to convert the csv files into Apache Parquet format.**
- **B. Partition the data by date and region in Amazon S3**
- C. Reduce the S3 object sizes to less than 126 MB
- D. Use Amazon Kinesis Data Analytics to run the Queries as part of the batch processing operation
- E. Store the files as large, single objects in Amazon S3.

**Answer: A,B**

Explanation:

<https://aws.amazon.com/blogs/big-data/top-10-performance-tuning-tips-for-amazon-athena/> This solution meets the requirements of measuring the effectiveness of marketing campaigns by performing batch processing on csv files of sales data and storing the results in an Amazon S3 bucket once every hour. An AWS Glue ETL process can use services such as AWS Glue or AWS Data Pipeline to extract data from S3, transform it into a more efficient format such as Apache Parquet, and load it back into S3. Apache Parquet is a columnar storage format that can improve the query performance and reliability of Athena by reducing the amount of data scanned, improving compression ratio, and enabling predicate pushdown.

#### NEW QUESTION # 229

A company uses on-premises servers to host its applications. The company is running out of storage capacity. The applications use both block storage and NFS storage. The company needs a high-performing solution that supports local caching without re-architecting its existing applications. Which combination of actions should a solutions architect take to meet these requirements? (Select TWO.)

- A. Deploy an AWS Storage Gateway volume gateway to replace the block storage
- B. Deploy AWS Snowball Edge to provision NFS mounts to on-premises servers.
- C. Deploy an AWS Storage Gateway file gateway to replace NFS storage.
- D. Deploy Amazon Elastic File System (Amazon EFS) volumes and mount them to on-premises servers.
- E. Mount Amazon S3 as a file system to the on-premises servers.

**Answer: A,C**

Explanation:

Explanation

<https://aws.amazon.com/storagegateway/file/>

File Gateway provides a seamless way to connect to the cloud in order to store application data files and backup images as durable objects in Amazon S3 cloud storage. File Gateway offers SMB or NFS-based access to data in Amazon S3 with local caching. It can be used for on-premises applications, and for Amazon EC2-based applications that need file protocol access to S3 object storage.

<https://aws.amazon.com/storagegateway/volume/>

Volume Gateway presents cloud-backed iSCSI block storage volumes to your on-premises applications.

Volume Gateway stores and manages on-premises data in Amazon S3 on your behalf and operates in either cache mode or stored mode. In the cached Volume Gateway mode, your primary data is stored in Amazon S3, while retaining your frequently accessed data locally in the cache for low latency access.

### NEW QUESTION # 230

A global marketing company has applications that run in the ap-southeast-2 Region and the eu-west-1 Region.

Applications that run in a VPC in eu-west-1 need to communicate securely with databases that run in a VPC in ap-southeast-2.

Which network design will meet these requirements?

- A. Configure a VPC peering connection between the ap-southeast-2 VPC and the eu-west-1 VPC. Update the subnet route tables. Create an inbound rule in the ap-southeast-2 database security group that allows traffic from the eu-west-1 application server IP addresses.
- B. Create a transit gateway with a peering attachment between the eu-west-1 VPC and the ap-southeast-2 VPC. After the transit gateways are properly peered and routing is configured, create an inbound rule in the database security group that references the security group ID of the application servers in eu-west-1.
- C. Configure a VPC peering connection between the ap-southeast-2 VPC and the eu-west-1 VPC. Update the subnet route tables. Create an inbound rule in the ap-southeast-2 database security group that references the security group ID of the application servers in eu-west-1.
- D. Create a VPC peering connection between the eu-west-1 VPC and the ap-southeast-2 VPC. Create an inbound rule in the eu-west-1 application security group that allows traffic from the database server IP addresses in the ap-southeast-2 security group.

**Answer: A**

Explanation:

Explanation

"You cannot reference the security group of a peer VPC that's in a different Region. Instead, use the CIDR block of the peer VPC."
