The current flowing through the conductor is directly proportional to the potential difference (V) across the two ends of a conductor, provided the physical state (Dimension, Temperature, etc.) of the conductor remains the same.

Mathematically can be written as $\quad I \propto V$

$$I = KV$$

where K is the constant of proportionality called conductance or the physical state of the conductor. Conductance is the opposite of resistance. Thus ($K = 1 / R$).

Rearranging the equation, we get $\quad I = \dfrac{V}{R}$

$$V = IR$$

where R is a constant called resistance. R depends on the dimensions of the conductor and also on the material of the conductor. Its S.I unit is the ohm (Ω).

Ohm's law Limitations:

There are some limitations to Ohm's law. They are as follows:

(i) Ohm's law is an empirical law which is found true for maximum experiments but not for all.

(ii) Some materials are non-ohmic under a weak electric field.

(iii) Ohm's law holds true only for a conductor at a constant temperature because
