### CompTIA A+ Certification Exam: Core 2 Sample Questions (Q136-Q141):

#### NEW QUESTION # 136

A user has been adding data to the same spreadsheet for several years. After adding a significant amount of data, they are now unable to open the file. Which of the following should a technician do to resolve the issue?

- A. Increase the amount of RAM.
- B. the storage drive.
- C. Revert the spreadsheet to the last restore point.

- D. Upgrade the network connection speed.

**Answer: A**

Explanation:

As spreadsheets grow in size and complexity, they demand more system memory to load and manipulate data. If the file becomes so large that the available RAM is insufficient, the application may fail to open it. Adding more RAM gives the spreadsheet software the resources it needs to load and work with the expanded dataset.

**NEW QUESTION # 137**

You are configuring a home network for a customer. The customer has requested the ability to access a Windows PC remotely, and needs all chat and optional functions to work in their game console.

**INSTRUCTIONS**

Use the drop-down menus to complete the network configuration for the customer. Each option may only be used once, and not all options will be used.

Then, click the + sign to place each device in its appropriate location.

If at any time you would like to bring back the initial state of the simulation, please click the Reset All button.

Wireless AP LAN

Firewall Screened Subnet

⋮

**Answer:**

Explanation:

See explanation below.

Explanation:

The completed configuration:

1. Wireless AP (LAN side)
1. LAN IP: 192.168.10.1
2. Encryption: WPA2 PSK
2. Router (port-forward rule)
1. Allow TCP Any 3389

This forwards inbound RDP traffic (TCP/3389) from the Internet to the Windows PC, enabling Remote Desktop access.

3. Firewall (screened subnet side)

1. LAN IP: 10.100.0.1

4. Device placement

1. PC: place behind the router (where the port-forward rule points).

2. Game console: place on the Wireless AP (so it can use chat and extra services over WPA2 PSK).

3. Firewall: place in front of the screened subnet (with its 10.100.0.1 IP facing that subnet).

The Windows PC is placed in the screened subnet (behind the firewall) for enhanced security. Remote access to this PC requires port forwarding of TCP port 3389 (RDP), which is correctly configured through the router.

The Game Console is placed on the Wireless AP LAN, using WPA2 PSK for a secure wireless connection.

Game consoles typically use peer-to-peer chat and online services that require open access without firewall restrictions, which is why the console is not placed behind the firewall.

CompTIA A+ 220-1102 Reference Points:

Objective 3.4: Given a scenario, implement best practices associated with data and device security.

Objective 2.4: Given a scenario, use appropriate tools to support and configure network settings.

Study Guide Reference: CompTIA A+ Core 2 guides recommend using screened subnets (a type of DMZ) for systems needing controlled external access, such as remote desktops, while placing gaming and media devices on less restricted networks for full functionality.

**NEW QUESTION # 138**

Recently, the number of users sharing smartphone passcodes has increased. The management team wants a technician to deploy a more secure screen lock method. Which of the following technologies should the technician use?

- A. Multifactor authentication
- B. Pattern lock
- **C. Facial recognition**
- D. Device encryption

**Answer: C**

Explanation:

Facial recognition leverages biometric characteristics unique to each user, offering stronger security than shared passcodes or easily observed pattern locks. It ensures that only the enrolled individual can unlock the device, reducing the risk of unauthorized access from shared codes.

**NEW QUESTION # 139**

A user's application only works with a legacy version of the OS. The OS is reaching its end of life date. For security reasons, the company is migrating to the current version of the OS. Which of the following is the most efficient way to complete the migration while maintaining accessibility to the application?

- A. Terminal server
- B. Bare-metal server
- C. Multiboot
- D. **Virtualization**

**Answer: D**

Explanation:

Virtualization allows the legacy OS to be run in a virtual machine (VM) on top of the newer OS.

This method provides backward compatibility without requiring outdated operating systems on physical hardware.

**NEW QUESTION # 140**

A company would like to deploy baseline images to new computers as they are started up on the network. Which of the following boot processes should the company use for this task?

- A. USB
- B. **PXE**
- C. Secure
- D. ISO

**Answer: B**

Explanation:

Preboot Execution Environment (PXE) allows new computers to boot over the network by pulling a boot image from a PXE server. This lets you automatically deploy baseline images as machines power on and receive their network-based boot instructions, without relying on local media like USB drives or ISOs.
