## Palo Alto Networks Cybersecurity Practitioner Sample Questions (Q209-Q214):

### NEW QUESTION # 209

Which of the following is a service that allows you to control permissions assigned to users in order for them to access and utilize cloud resources?

- A. User-ID
- **B. Identity and Access Management (IAM)**
- C. User and Entity Behavior Analytics (UEBA)
- D. Lightweight Directory Access Protocol (LDAP)

**Answer: B**

Explanation:

Identity and access management (IAM) is a software service or framework that allows organizations to define user or group identities within software environments, then associate permissions with them. The identities and permissions are usually spelled out in a text file, which is referred to as an IAM policy.

**NEW QUESTION # 210**

Which feature of cloud-native security platforms (CNSPs) focuses on protecting virtual machine (VM), container, and serverless deployments against application-level attacks during runtime?

- A. Asset inventory
- B. Configuration assessment
- C. Workload security
- D. Data security

**Answer: C**

Explanation:

Workload security in a Cloud-Native Security Platform (CNSP) focuses on protecting VMs, containers, and serverless deployments against application-level attacks during runtime. It ensures that workloads remain secure by monitoring behavior, enforcing policies, and detecting threats in real time.

**NEW QUESTION # 211**

Which type of LAN technology is being displayed in the diagram?

- A. Star Topology
- B. Spine Leaf Topology
- C. Mesh Topology
- D. Bus Topology

**Answer: C**

Explanation:

The diagram displays a mesh topology, where each device is connected to every other device in the network. This topology is

characterized by the multiple connections each node has, ensuring there is no single point of failure and providing redundant paths for data transmission, enhancing the reliability and resilience of the network. Mesh topology is one of the types of LAN technology that uses ethernet or Wi-Fi to connect devices<sup>12</sup>. Reference:

#### NEW QUESTION # 212

What is a key advantage and key risk in using a public cloud environment?

- A. Multiplexing
- B. Dedicated Networks
- C. Multi-tenancy
- D. Dedicated Hosts

**Answer: C**

Explanation:

Multitenancy is a key characteristic of the public cloud, and an important risk. Although public cloud providers strive to ensure isolation between their various customers, the infrastructure and resources in the public cloud are shared. Inherent risks in a shared environment include misconfigurations, inadequate or ineffective processes and controls, and the "noisy neighbor" problem (excessive network traffic, disk I/O, or processor use can negatively impact other customers sharing the same resource). In hybrid and multicloud environments that connect numerous public and/or private clouds, the delineation becomes blurred, complexity increases, and security risks become more challenging to address.

#### NEW QUESTION # 213

Why is it important to protect East-West traffic within a private cloud?

- A. All traffic contains threats, so enterprises must protect against threats across the entire network
- B. East-West traffic contains more threats than other traffic
- C. East-West traffic uses IPv6 which is less secure than IPv4
- D. East-West traffic contains more session-oriented traffic than other traffic

**Answer: A**

Explanation:

East-West traffic is the lateral movement of data packets between servers within a data center, or across private and public clouds<sup>1</sup>. This type of traffic has grown substantially with the proliferation of data centers and cloud adoption, and it now surpasses the conventional North-South traffic that goes in or out of the network<sup>2</sup>. Therefore, it is important to protect East-West traffic from potential malicious actors and breaches, as threats can arise internally and move laterally without ever touching the traditional network perimeter<sup>12</sup>. By inspecting and monitoring all East-West traffic, organizations can effectively block the lateral movement of threat actors, increase network visibility, protect vital applications and data, and lower costs and risks for distributed operations<sup>23</sup>.
