SPLK-1002 Valid Dumps Sheet - 100% Pass Splunk SPLK-1002 First-grade Sure Pass

There are a lot of the functions on our SPLK-1002 exam questions to help our candidates to reach the best condition before they

take part in the real exam. I love the statistics report function and the timing function most. The statistics report function helps the learners find the weak links and improve them accordingly. The timing function of our SPLK-1002 training quiz helps the learners to adjust their speed to answer the questions and keep alert and our SPLK-1002 study materials have set the timer.

Splunk Core Certified Power User Exam Sample Questions (Q175-Q180):

NEW QUESTION # 175

Complete the search, | _____ failure>successes

- A. Search
- **B. Where**
- C. Any of the above
- D. If

Answer: B

Explanation:

Explanation

The where command can be used to complete the search below.

... | where failure>successes

The where command is a search command that allows you to filter events based on complex or custom criteria.

The where command can use any boolean expression or function to evaluate each event and determine whether to keep it or discard it. The where command can also compare fields or perform calculations on fields using operators such as >, <, =, +, -, etc. The where command can be used after any transforming command that creates a table or a chart.

The search string below does the following:

It uses ... to represent any search criteria or commands before the where command.

It uses the where command to filter events based on a comparison between two fields: failure and successes.

It uses the greater than operator (>) to compare the values of failure and successes fields for each event.

It only keeps events where failure is greater than successes.

NEW QUESTION # 176

To identify all of the contributing events within a transaction that contains at least one REJECT event, which syntax is correct?

- A. Index=main | transaction sessionid | where transaction=reject"
- B. Index=main | transaction sessionid | whose transaction=reject
- C. Index-main | REJECT trans sessionid
- **D. Index-main | transaction sessionid | search REJECT**

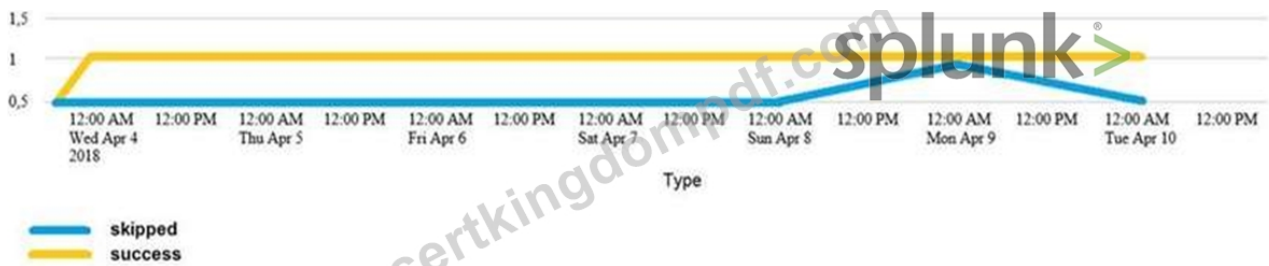

Answer: D

Explanation:

The transaction command is used to group events that share a common value for one or more fields into transactions2. The transaction command assigns a transaction ID to each group of events and creates new fields such as duration, eventcount and eventlist for each transaction2. To identify all of the contributing events within a transaction that contains at least one REJECT event, you can use the following syntax: index=main | transaction sessionid | search REJECT2. This search will first group the events by sessionid, then filter out the transactions that do not contain REJECT in any of their events2. Therefore, option B is correct, while options A, C and D are incorrect because they do not follow the correct syntax for using the transaction command or the search command.

NEW QUESTION # 177

Which of the following searches would create a graph similar to the one below?

index=_internal sourcetype=SavedSplunker | fields sourcetype, status |

- A. transaction status maxspan=1d | chart count OVER status by _time
index=_internal sourcetype=SavedSplunker | fields sourcetype, status |
- B. transaction status maxspan=1d | timechart count by status
- C. transaction status maxspan=1d | stats count by status
index=_internal sourcetype=SavedSplunker | fields sourcetype, status |
- D. None of these searches would generate a similar graph.

Answer: D

Explanation:

None of these functions related to the graph in exhibit. All of these functions have maxspan=1d which is not a valid argument.

NEW QUESTION # 178

Data models are composed of one or more of which of the following datasets? (Choose all that apply.)

- A. Search datasets
- B. Any child of event, transaction, and search datasets
- C. Events datasets
- D. Transaction datasets

Answer: A,C,D

Explanation:

Explanation/Reference: <https://docs.splunk.com/Documentation/Splunk/8.0.3/Knowledge/Aboutdatamodels>

NEW QUESTION # 179

A Splunk app is configured to extract domain names in web service logs and specify them as a field named domain.

What workflow action would return an external IP lookup for the field named domain?

- A. Search
- B. PUT
- C. GET
- D. POST

Answer: C

Explanation:

In Splunk, a workflow action that returns an external IP lookup for a field named domain would typically use the GET method. This HTTP method is used to retrieve data from a specified resource, which is appropriate for looking up information based on the domain field.
