Google Cloud Certified - Professional Cloud Database Engineer Sample Questions (Q131-Q136):

NEW QUESTION # 131

You released a popular mobile game and are using a 50 TB Cloud Spanner instance to store game data in a PITR-enabled production environment. When you analyzed the game statistics, you realized that some players are exploiting a loophole to gather more points to get on the leaderboard. Another DBA accidentally ran an emergency bugfix script that corrupted some of the data in the production environment. You need to determine the extent of the data corruption and restore the production environment. What should you do? (Choose two.)

- A. If the corruption is insignificant, perform a stale read and specify a recovery timestamp. Write the results back.
- B. If the corruption is significant, use import and export.
- C. If the corruption is significant, perform a stale read and specify a recovery timestamp. Write the results back.
- D. If the corruption is significant, use backup and restore, and specify a recovery timestamp.
- E. If the corruption is insignificant, use backup and restore, and specify a recovery timestamp.

Answer: A,D

Explanation:

<https://cloud.google.com/spanner/docs/pitr#ways-to-recover>

To recover the entire database, backup or export the database specifying a timestamp in the past and then restore or import it to a new database. This is typically used to recover from data corruption issues when you have to revert the entire database to a point-in-time before the corruption occurred.

This part describes significant corruption - A

To recover a portion of the database, perform a stale read specifying a query-condition and timestamp in the past, and then write the results back into the live database. This is typically used for surgical operations on a live database. For example, if you accidentally delete a particular row or incorrectly update a subset of data, you can recover it with this method.

This describes insignificant corruption case - E

NEW QUESTION # 132

Your customer has a global chat application that uses a multi-regional Cloud Spanner instance. The application has recently experienced degraded performance after a new version of the application was launched. Your customer asked you for assistance. During initial troubleshooting, you observed high read latency. What should you do?

- A. Change the Cloud Spanner configuration from multi-region to single region.
- B. Use SQL statements to analyze SPANNER_SYS.QUERY_STATS* tables.
- C. Use SQL statements to analyze SPANNER_SYS.READ_STATS* tables.
- D. Use query parameters to speed up frequently executed queries.

Answer: C

Explanation:

To troubleshoot high read latency, you can use SQL statements to analyze the SPANNER_SYS.READ_STATS* tables. These tables contain statistics about read operations in Cloud Spanner, including the number of reads, read latency, and the number of read

errors. By analyzing these tables, you can identify the cause of the high read latency and take appropriate action to resolve the issue. Other options, such as using query parameters to speed up frequently executed queries or changing the Cloud Spanner configuration from multi-region to single region, may not be directly related to the issue of high read latency. Similarly, analyzing the SPANNER_SYS.QUERY_STATS* tables, which contain statistics about query operations, may not be relevant to the issue of high read latency.

NEW QUESTION # 133

You are building a data warehouse on BigQuery. Sources of data include several MySQL databases located on-premises. You need to transfer data from these databases into BigQuery for analytics. You want to use a managed solution that has low latency and is easy to set up. What should you do?

- A. Use Cloud Data Fusion and scheduled workflows to extract data from MySQL. Transform this data into the appropriate schema, and load this data into your BigQuery database.
- B. Use Database Migration Service to replicate data to a Cloud SQL for MySQL instance. Create federated tables in BigQuery on top of the replicated instances to transform and load the data into your BigQuery database.
- C. Create extracts from your on-premises databases periodically, and push these extracts to Cloud Storage. Upload the changes into BigQuery, and merge them with existing tables.
- D. Use Datastream to connect to your on-premises database and create a stream. Have Datastream write to Cloud Storage. Then use Dataflow to process the data into BigQuery.

Answer: D

NEW QUESTION # 134

You are managing a Cloud SQL for PostgreSQL instance in Google Cloud. You need to test the high availability of your Cloud SQL instance by performing a failover. You want to use the cloud command. What should you do?

- A. Use `gcloud sql instances failover <ReplicaInstanceName>`.
- B. Use `gcloud sql instances failover <PrimaryInstanceName>`.
- C. Use `gcloud sql instances promote-replica <PrimaryInstanceName>`.
- D. Use `gcloud sql instances promote-replica <ReplicaInstanceName>`.

Answer: D

NEW QUESTION # 135

Your team uses thousands of connected IoT devices to collect device maintenance data for your oil and gas customers in real time. You want to design inspection routines, device repair, and replacement schedules based on insights gathered from the data produced by these devices. You need a managed solution that is highly scalable, supports a multi-cloud strategy, and offers low latency for these IoT devices. What should you do?

- A. Use MongoDB Atlas with Charts.
- B. Use Firestore with Looker.
- C. Use Cloud Spanner with Data Studio.
- D. Use Bigtable with Looker.

Answer: A
