Salesforce PDII Dumps [2026] - To Acquire Very Best Final Results

The clients can consult our online customer service before and after they buy our PDII study materials. We provide considerate customer service to the clients. Before the clients buy our PDII study materials they can consult our online customer service personnel about the products' version and price and then decide whether to buy them or not. After the clients buy the PDII study materials they can consult our online customer service about how to use them and the problems which occur during the process of using. If the clients fail in the test and require the refund our online customer service will reply their requests quickly and deal with the refund procedures promptly. In short, our online customer service will reply all of the clients' questions about the PDII Study Materials timely and efficiently.

Salesforce Platform Developer II Sample Questions (Q49-Q54):

NEW QUESTION # 49

Refer to the code snippet below:

As part of an Integration development effort, a developer is tasked to create an Apex method that solely relies on the use of foreign identifiers. In order to relate new contact records to existing Accounts in Salesforce. The account object contains a field marked as an external ID, the API Name of this field is Legacy_Id__c.

What is the most efficient way to instantiate the parentAccount variable on line 02 to ensure the newly created contact is properly related to the Account?

- ☐ A)
- ☐ B)
- ☐ C)
- ☐

D)

□

- A. Option C
- B. Option B
- C. Option D
- **D. Option A**

Answer: D

NEW QUESTION # 50

A developer wrote a class named AccountHistoryManager that relies on field history tracking. The class has a static method called getAccountHistory that takes in an Account as a parameter and returns a list of associated AccountHistory object records. The following test fails:

Java

@isTest

```
public static void testAccountHistory(){
```

```
Account a = new Account(name = 'test');
```

```
insert a;
```

```
a.name = a.name + '1';
```

```
update a;
```

```
List<AccountHistory> ahList = AccountHistoryManager.getAccountHistory(a); System.assert(ahList.size() > 0);
```

```
}
```

What should be done to make this test pass?

- A. Use @isTest(SeeAllData=true) to see historical data from the org and query for AccountHistory records.
- B. The test method should be deleted since this code cannot be tested.
- **C. Use Test.isRunningTest() in getAccountHistory() to conditionally return fake AccountHistory records.**
- D. Create AccountHistory records manually in the test setup and write a query to get them.

Answer: C

Explanation:

A significant challenge in Salesforce unit testing is that system-generated records, such as those in the AccountHistory or OpportunityHistory objects, are not created during the execution of a test method, even if field history tracking is enabled in the organization. Because these records are read-only and managed by the system, a developer cannot manually insert them via DML within a test setup. Consequently, the query in the getAccountHistory method will always return an empty list in a test context, causing the System.assert to fail.

The optimal programmatic solution to this limitation is to implement a "mocking" strategy using Test.

isRunningTest(). By modifying the production code within getAccountHistory, the developer can check if the code is currently being executed by a unit test. If it is, the method can return a manually constructed list of AccountHistory records (stored in memory but not inserted into the database) to satisfy the test's requirements. This allows the test to verify the logic that processes the history data without needing the system to actually generate historical records. While SeeAllData=true (Option A) would allow the test to see real data in the org, it is considered a poor practice because it makes the test dependent on the specific state of the organization's data, leading to brittle tests that may fail in different environments.¹²

NEW QUESTION # 51

What is a benefit of using a WSDL with Apex?

- **A. Allows for classes to be imported into Salesforce**
- B. Enables the user to not pass a Session ID where it is not necessary
- C. Allows for web services to be tested and achieve code coverage
- D. Reduces the number of callouts to third-party web services

Answer: A

NEW QUESTION # 52

A software company uses a custom object, Defect__c, to track defects in their software. Defect__c has organization-wide defaults set to private. Each Defect__c has a related list of Reviewer__c records, each with a lookup field to User that is used to indicate that the User will review the Defect__c. What should be used to give the User on the Reviewer__c record read only access to the Defect__c record on the Reviewer__c record?

34

- A. Criteria-based sharing56
- B. Lightning web component78
- C. View All on Defect__c
- **D. Apex managed sharing910**

Answer: D

Explanation:

Comprehensive and Detailed 150 to 250 words 13of Explanation:14

In a Private sharing model, access is strictly limited to owners and those granted access through specific sharing mechanisms.

Here, the requirement is to grant access based on a User lookup field residing on a child record (Reviewer__c) to the parent record (Defect__c).

Criteria-based sharing rules (B) are ineffective here because they can only evaluate fields on the record being shared (Defect__c) and cannot "look down" at values in related child records to determine access. "View All" (A) is too broad as it would grant the user access to every defect in the system, violating the private security model.

Apex managed sharing (D) is the correct choice. Because the relationship between the assigned reviewer and the defect is dynamic and based on a separate object, a developer can write an Apex trigger on the Reviewer__c object. When a reviewer record is created or updated, the trigger programmatically inserts a record into the Defect__Share table, granting 'Read' access to the User specified in the lookup field. This provides the precision required to ensure that only the designated reviewers can see specific defects, maintaining the integrity of the Private OWD while automating the necessary exceptions.

NEW QUESTION # 53

A user receives the generic "An internal server error has occurred" while interacting with a custom Lightning Component. What should the developer do to ensure a more meaningful message?

- A. Use ProcessBuilder to catch the error.
- B. Add an onerror event handler to the tag.
- **C. Use an AuraHandledException in a try/catch block.**
- D. Add an error-view component to the markup.

Answer: C
