Relativity Certified Administrator Sample Questions (Q79-Q84):

NEW QUESTION # 79

After imaging the documents in preparation for production, the case team asks for the estimated image count of the production. How can you quickly obtain the image count for the case team?

- A. Export the results of the Mass Convert operation.
- **B. Use the Tally/Sum/Average mass operation on the Relativity Image Count field.**
- C. Export the Relativity Image Count field and calculate it in Excel.
- D. Use the Has Images widget on your pre-production dashboard.

Answer: B

Explanation:

The correct answer is D. Use the Tally/Sum/Average mass operation on the Relativity Image Count field.

Relativity's Tally/sum/average documentation says this mass operation is commonly used to determine the number of pages in a print job or production. Relativity also specifically documents, in related guidance, that to estimate project size you can use Tally/sum/average on the Relativity Image Count field.

This makes it the fastest and most direct built-in method for obtaining an image count estimate. The other options are less efficient or are not the documented workflow for quickly producing a total image count.

Therefore, the correct answer is to use Tally/Sum/Average on the Relativity Image Count field.

NEW QUESTION # 80

What operation does the document re-production feature support?

- A. Replace produced images with a native.
- B. Replace a document that was produced as native only with produced images.
- **C. Replace produced images with a placeholder.**
- D. Replace a document that was produced as a placeholder with another placeholder.

Answer: C

Explanation:

The correct answer is D. Replace produced images with a placeholder. Relativity's official Re-production documentation lists supported and unsupported re-production types. Among the supported types, Relativity explicitly includes Replace produced images with placeholder (I-P) .

The same documentation also explicitly lists several unsupported types that correspond to the incorrect options in this question. Relativity states that replacing a document that was produced as native only with produced images or a placeholder is unsupported, which rules out option B. It also states that replacing a document that was produced as a placeholder with another placeholder is unsupported, which rules out option C. Option A is likewise unsupported because "replace produced images with a native" is not identified as a supported re-production type. Instead, Relativity supports image-to-placeholder, placeholder-to-images, and re-producing documents with the same number of pages.

This distinction matters because re-production is tightly controlled to preserve numbering integrity and production consistency. For example, when replacing produced images with placeholders, Relativity preserves the original Bates numbering while substituting placeholder pages. From an RCA production- administration perspective, the supported operation among the listed choices is clearly Replace produced images with a placeholder . Therefore, the correct answer is D .

NEW QUESTION # 81

What field is set when adding a production data source to a production set?

- A. Branding text size
- **B. Production type**
- C. Production numbering
- D. Placeholder image format

Answer: B

Explanation:

The correct answer is B. Production type. Relativity's official Production Data Source documentation states that when adding a production data source, one of the fields you configure is Production Type , where you select whether the data source will produce images, natives, or both . This is explicitly part of the production data source setup dialog.

This makes sense because production data sources are used to attach saved searches to a production set and can define how those specific subsets of documents should be produced. Relativity also documents that placeholders can be assigned at the production data source level so that different saved searches in the same production can use different placeholder behavior. However, Production Numbering is defined at the production set level rather than as a field you set when creating the individual production data source.

Likewise, Branding text size and Placeholder image format are production-level settings, not the core field identified in the data source setup described by Relativity.

From an RCA standpoint, this distinction matters because administrators configure overall production behavior in the production set, while more granular document-source behavior is controlled on each production data source. Therefore, the correct answer is B. Production type .

NEW QUESTION # 82

What aliases will Name Normalization identify from the email below?

From: "Lin, David" David.Lin@example.com

- D. * "Lin, David" David.Lin@example.com
* Ali.Devi@example.com
* rjones@domain.com
* "Lin, David"
* David.Lin@example.com
* Ali.Devi@example.com
* Skylar

Answer: B

Explanation:

The correct answer is C . Relativity's official Name Normalization documentation explains that the process parses the email headers -specifically From, To, Cc, and Bcc -to identify aliases. It does not create aliases from every casual name reference appearing in the email body. Relativity further states that when an alias appears in the format "Doe, John" john.doe@example.com , Name

Normalization stores three aliases:

the full alias , the description/name portion , and the email address portion . Applying that exact documented rule here means the From value "Lin, David" David.Lin@example.com yields three aliases:

"Lin, David" David.Lin@example.com , "Lin, David" , and David.Lin@example.com . The To header contributes Ali.Devi@example.com .

Relativity also explicitly notes that generic aliases such as simple first names are not created in order to avoid over-merging. In addition, the alias-identification process is driven by the parsed header sections , not by every name or email string appearing in the message body. That means items such as Ali , Skylar , Rush Jones , rjones@domain.com , and Dave Lin are not the correct header-derived aliases for this example. The body text may help Relativity with segment matching in some contexts, but the direct alias list in this question comes from the email headers. Therefore, the correct identified aliases are the four listed in option C .

NEW QUESTION # 83

When must you run a full build of a dtSearch index?

- A. After adding new documents.
- B. After removing documents from the search.
- C. After using Swap Index.
- **D. After updating fields in the searchable set.**

Answer: D

Explanation:

The correct answer is A. After updating fields in the searchable set. Relativity's dtSearch index documentation states that you must perform a full build when you add an additional field to the index, change any index settings, change fields of the searchable set, or overlay text on existing fields . That directly matches option A.

By contrast, Relativity documents that an incremental build is used after adding or removing documents .

That makes options B and D incorrect. "After using Swap Index" is not listed as a required trigger for a full build in the dtSearch console documentation. Therefore, the correct answer is that a full build is required after updating fields in the searchable set .
