Pass4suresVCE recognizes the acute stress the aspirants undergo to get trust worthy and authentic SAP Certified Associate - Integration Developer (C-CPI-2506) exam study material. They carry undue pressure with the very mention of appearing in the SAP C-CPI-2506 certification test. Here the Pass4suresVCE come forward to prevent them from stressful experiences by providing excellent and top-rated SAP Certified Associate - Integration Developer (C-CPI-2506) practice test questions to help them hold the SAP Certified Associate - Integration Developer (C-CPI-2506) certificate with pride and honor.

## SAP C-CPI-2506 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Implementing Cloud Integration: This section of the exam measures the skills of Integration Consultants and examines how cloud integration flows are designed and deployed. It emphasizes creating integration scenarios, handling connectivity, and applying best practices to build efficient, secure, and reliable integration processes in SAP's cloud environment.</li></ul>

Topic 2	<ul style="list-style-type: none"> <li>Managing APIs: This section of the exam measures the skills of Solution Architects and focuses on managing APIs within the SAP ecosystem. It covers topics such as API provisioning, lifecycle management, security policies, and monitoring, ensuring candidates can handle APIs effectively for enterprise integration needs.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>SAP Integration Suite Overview: This section of the exam measures the skills of Integration Consultants and covers the foundational concepts of the SAP Integration Suite. It provides an understanding of the suite's capabilities, its role in connecting applications, and its relevance in modern cloud-based integration scenarios.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>SAP Event Mesh: This section of the exam measures the skills of Solution Architects and centers on using SAP Event Mesh to support event-driven integration. It highlights the importance of asynchronous communication, event publishing, and subscription models, allowing organizations to build scalable and decoupled systems.</li> </ul>

## C-CPI-2506 Exam Bootcamp: SAP Certified Associate - Integration Developer & C-CPI-2506 Original Questions & C-CPI-2506 Exam Prep

It's crucial to have reliable SAP C-CPI-2506 exam questions and practice test to prepare for the C-CPI-2506 Exam. Pass4suresVCE offers real SAP C-CPI-2506 exam questions with accurate answers in our C-CPI-2506 practice exam format. Our C-CPI-2506 Practice Questions and answers resemble the actual SAP C-CPI-2506 questions, and they have been verified by experts to ensure your success in the SAP Certified Associate - Integration Developer Exam with ease.

### SAP Certified Associate - Integration Developer Sample Questions (Q48-Q53):

#### NEW QUESTION # 48

You have set up an integration process to use a SOAP adapter. Which event allows you to run the integration flow directly after deployment?

- A. End Message
- B. Start Message**
- C. End Event
- D. Start Event

#### Answer: B

Explanation:

A Start Message event allows you to run the integration flow directly after deployment. A Start Message event is triggered when a message arrives at the integration flow through an inbound channel, such as a SOAP adapter. You can use a Start Message event to initiate an integration process based on a message input. Reference: Modernize Integration with SAP Integration Suite | openSAP

#### NEW QUESTION # 49

Which combination of SAP BTP role collections allows a user to manage queues and topic subscriptions in SAP Event Mesh, and monitor its usage and resources?

- A. SecurityAdmin and SecurityDevelop
- B. ApplicationAdmin and ApplicationDevelop
- C. IntegrationAdmin and IntegrationDevelop
- D. EventMeshAdmin and EventMeshDevelop**

#### Answer: D

Explanation:

In SAP BTP, SAP Event Mesh provides messaging capabilities (queues, topics, and subscriptions) that require specific role collections to enable developers and administrators to perform tasks. SAP delivers two dedicated role collections for Event Mesh: EventMeshDeveloper:

Manages queues and topic subscriptions

Monitors Event Mesh and its queues

Performs testing of queues and message flows

EventMeshAdmin:

Includes all developer capabilities

Provides additional administration rights for lifecycle management of Event Mesh instances and configurations. When a user is assigned these role collections, they gain the ability to:

Create and manage queues and topic subscriptions.

Monitor usage and resources such as queue depth, consumers, connections, and spool size within Event Mesh.

Other provided options are incorrect:

ApplicationAdmin/ApplicationDevelop # These are not SAP Event Mesh role collections, they do not provide queue or topic subscription access.

SecurityAdmin/SecurityDevelop # These roles are tied to security configurations and do not allow Event Mesh operations.

IntegrationAdmin/IntegrationDevelop # These roles belong to SAP Integration Suite (Cloud Integration) capability, not Event Mesh. Therefore, the correct and verified answer according to SAP Integration Developer documentation is:

B). EventMeshAdmin and EventMeshDevelop

## NEW QUESTION # 50

What does an API consumer do?

- A. It invokes an interface.
- B. It provides the server-side implementation of an interface.
- C. It provides an interface.

**Answer: A**

Explanation:

An API consumer is an application or system that invokes an interface provided by an API provider. An API consumer uses the interface to access or manipulate data or functionality exposed by the API provider. An API consumer can be a web browser, a mobile app, a cloud service, or any other client that can send requests and receive responses from an API provider. Reference: Integration Software | SAP Integration Suite, Modernize Integration with SAP Integration Suite | openSAP

## NEW QUESTION # 51

What must you do to find out which entity sets are available in the OData V2.0 interface?

- A. Search in the Global Directory of all available OData interfaces.
- B. Contact the OData interface manufacturer.
- C. Retrieve the service document from the interface.
- D. **Retrieve the metadata document from the interface.**

**Answer: D**

Explanation:

In SAP Integration Development, particularly when working with OData V2.0 interfaces, the correct way to identify the available entity sets is by retrieving the metadata document from the OData service. The metadata document, accessible via the \$metadata endpoint of the OData service, provides a comprehensive description of the service's data model, including all entity sets, entity types, properties, associations, and navigation properties. This document is formatted in XML (CSDL - Conceptual Schema Definition Language) and is essential for understanding the structure and capabilities of the OData service.

Why Option B is Correct:

\* Metadata Document Role: The metadata document is a standard feature of OData V2.0 services, as defined by the OData protocol. It exposes the schema of the service, listing all entity sets and their properties. For example, accessing [https://<service-url>/\\$metadata](https://<service-url>/$metadata) returns an XML document detailing the entity sets, such as Customers, Orders, or other resources exposed by the service.

\* SAP Reference: According to SAP documentation, such as the SAP Gateway Developer Guide and OData V2.0 Protocol Specification, the metadata document is the primary source for discovering the structure of an OData service. In SAP Gateway, which is commonly used for OData services in SAP environments, the \$metadata endpoint is automatically generated when an

OData service is created using the Service Builder (transaction SEGW).

\* Practical Usage: In SAP Integration Suite or SAP Cloud Integration, developers use the metadata document to configure integration flows (iFlows) that interact with OData services. Tools like SAP Business Application Studio or Eclipse with SAP plugins allow developers to import this metadata to generate client code or configure adapters.

Why Other Options are Incorrect:

\* A. Retrieve the service document from the interface: The service document (accessed via the root URL of the OData service, e.g., <https://<service-uri>/>) provides a list of entity sets but only includes their names and URLs, not the detailed structure (e.g., properties, types, or relationships). While it's useful for navigating to entity sets, it lacks the comprehensive schema information provided by the metadata document, making it insufficient for fully understanding the entity sets' structure.

\* C. Search in the Global Directory of all available OData interfaces: There is no such thing as a "Global Directory" for OData interfaces in SAP or the broader OData ecosystem. OData services are specific to individual systems or applications, and their discovery is typically done via the service's metadata or service document, not a centralized directory.

\* D. Contact the OData interface manufacturer: This option is not practical or standard. OData is a protocol, not a product with a "manufacturer." The metadata document is the standard, self-contained way to explore an OData service, and no external contact is required.

SAP Integration Developer Workflow Example:

\* Access the OData Service: In an SAP environment, an Integration Developer identifies the OData service URL (e.g., [https://<host>:<port>/sap/opu/odata/sap/<service\\_name>/](https://<host>:<port>/sap/opu/odata/sap/<service_name>)).

\* Retrieve Metadata: Append /\$metadata to the service URL to download the metadata XML. For example, [https://<host>:<port>/sap/opu/odata/sap/ZCUSTOMER\\_SRV/\\$metadata](https://<host>:<port>/sap/opu/odata/sap/ZCUSTOMER_SRV/$metadata).

\* Analyze Entity Sets: Parse the <EntitySet> elements in the metadata XML to identify available entity sets, their properties, and navigation paths.

\* Use in Integration: In SAP Cloud Integration, import the metadata into an iFlow's OData adapter to configure operations like querying or updating specific entity sets.

References:

SAP Help Portal: SAP Gateway Developer Guide - "OData Service Metadata" section, which explains the role of the \$metadata endpoint in exposing entity sets and their schema.

OData V2.0 Specification: Section 2.2.3.7.1, "Metadata Document," which mandates that OData services provide a metadata document describing entity sets and other resources.

SAP Integration Suite Documentation: "OData Adapter" section, which details how metadata is used to configure integration flows for OData services.

SAP Community Blogs: Articles on OData development in SAP Gateway, such as "Building OData Services with SAP Gateway," emphasize using the metadata document for service exploration.

## NEW QUESTION # 52

You want to implement a synchronous call to a remote HTTP API as an integration flow component. Which adapter can you use?

- A. Mail
- **B. OData**
- C. SFTP
- D. AMQP

**Answer: B**

Explanation:

For a synchronous call to a remote HTTP API in an integration flow:

The OData adapter (or HTTP adapter) is used to perform synchronous request-reply communication with REST-based services.

AMQP # Messaging protocol, not synchronous.

SFTP # File-based transfer, asynchronous.

Mail # For SMTP/IMAP, not synchronous API calls.

Thus, the correct adapter for a synchronous remote API call is OData (or HTTP adapter, depending on configuration).

## NEW QUESTION # 53

.....

Our C-CPI-2506 study materials have a professional attitude at the very beginning of its creation. The series of C-CPI-2506 measures we have taken is also to allow you to have the most professional products and the most professional services. I believe that in addition to our C-CPI-2506 Exam Questions, you have also used a variety of products. We believe if you compare our C-

CPI-2506 training guide with the others, you will choose ours at once.
