This Salesforce Certified MuleSoft Developer (Mule-Dev-201) (Salesforce-MuleSoft-Developer-I) practice exam software is easily accessible on all Windows laptops and computers. You do not require an active internet connection after installation of the Salesforce Certified MuleSoft Developer (Mule-Dev-201) (Salesforce-MuleSoft-Developer-I) practice exam software. Repetitive attempts of Salesforce Certified MuleSoft Developer (Mule-Dev-201) (Salesforce-MuleSoft-Developer-I) exam dumps boosts confidence and provide familiarity with the Salesforce-MuleSoft-Developer-I actual exam format.

Salesforce Salesforce-MuleSoft-Developer-I Exam Syllabus Topics:

Topic	Details
Topic 1	• Creating Application Networks: The topic of creating Application Networks encompasses understanding MuleSoft's proposal for closing the IT delivery gap and describing the role and characteristics of the modern API. It also includes the purpose and roles of a Center for Enablement (C4E), and the benefits of API-led.
Topic 2	• Accessing and Modifying Mule Events: It describes the Mule event data structure. Moreover, the topic focuses on usage of transformers and enriching Mule events.
Topic 3	• Using Connectors: It focuses on retrieving data from REST services using HTTP Request or REST Connector. Moreover, the topic covers using a Web Service Consumer connector for SOAP web services and the Transform Message component.
Topic 4	• Routing Events: It focuses on using the Choice router for conditional logic and the Scatter-Gather router to multicast events. This topic also involves validating data by using the Validation module.
Topic 5	• Transforming Data with DataWeave: It involves writing DataWeave scripts and using DataWeave functions. This topic also includes defining and using DataWeave variables, functions, and modules, and applying correct syntax.
Topic 6	• Handling Errors: Handling errors includes describing default error handling in Mule applications and defining custom global default error handlers. It involves comparing On Error Continue and On Error Propagate scopes, creating error handlers for a flow, using the Try scope, and mapping errors to custom application errors.
Topic 7	• Structuring Mule Applications: Structuring Mule applications covers parameterizing an application and defining and reusing global configurations. It includes breaking an application into multiple flows using private flows, subflows, and the Flow Reference component.

Topic 8	• Deploying and Managing APIs and Integrations: It includes packaging Mule applications for deployment and deploying them to CloudHub. This topic also involves using CloudHub properties, creating and deploying API proxies, connecting an API implementation to API Manager, and applying policies to secure an API.
Topic 9	• Building API Implementation Interfaces: This topic involves manually creating a RESTful interface for a Mule application and generating a REST Connector from a RAML specification. It also includes describing the features and benefits of APIkit.

Free PDF Quiz 2026 Salesforce Useful Latest Salesforce-MuleSoft-Developer-I Test Labs

The world is a stage. We must seize all opportunities for career progression and to actualize our dream. So, you must seize TrainingDump to undersell yourself in the future. TrainingDump Salesforce Salesforce-MuleSoft-Developer-I study guide will help you to overcome difficulties and to get the certification. We will help you to understand the laws of Salesforce-MuleSoft-Developer-I Exam. TrainingDump provides original questions and pdf real questions and answers. If you get the certification, you will rise to undreamed-of heights.

Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q100-Q105):

NEW QUESTION # 100

Pick the component with which DataWeave is tightly integrated.

- A. Flow Designer
- **B. Mule runtime**
- C. All APIs
- D. Exchange

Answer: B

Explanation:

Correct answer is Mule runtime

DataWeave is the MuleSoft expression language for accessing and transforming data that travels through a Mule app. DataWeave is tightly integrated with the Mule runtime engine, which runs the scripts and expressions in your Mule app.

Mule Doc Reference : <https://docs.mulesoft.com/mule-runtime/4.3/dataweave>

NEW QUESTION # 101

Refer to the exhibits. The main flow contains an HTTP Request operation configured to call the child flow's HTTP Listener.

Aweb client sends a GET request to the HTTP Listener with the sty query parameter set to 30.

After the HTTP Request operation completes, what parts of the Mule event at the main flow's Logger component are the same as the Mule event that was input to theHTTP Request operation?

```
<http:listener-config name="HTTP_Listener_config" doc:name="HTTP Listener config" >
  <http:listener-connection host="0.0.0.0" port="8081" />
</http:listener-config>

<flow name="main" >
  <http:listener doc:name="HTTP: GET /order" config-ref="HTTP_Listener_config" path="/order"/>
  <set-payload value='Order01' doc:name="Order01" />
  <set-variable value="#[attributes.queryParams.qty]" doc:name="quantity to qty param"
    variableName="quantity"/>
  <http:request method="POST" doc:name="POST http://localhost:8081/child"
    url="http://localhost:8081/child"></http:request>
  <logger level="INFO" doc:name="Logger" message="#[output application/json ---
    { flow: "parent", qtyAttribute: attributes.queryParams.qty, quantityVar: vars.quantity, payload: payload }]" />
</flow>

<flow name="child" >
  <http:listener doc:name="HTTP: POST /child" config-ref="HTTP_Listener_config" path="/child"/>
  <logger level="INFO" doc:name="Logger"
    message="#[output application/json ---
    { flow: "child", qtyAttribute: attributes.queryParams.qty, quantityVar: vars.quantity, payload: payload }]" />
  <set-payload value="child flow finished" doc:name="child flow finished" />
</flow>
```

- A. The payload and all attributes
- B. All variables
- C. The entire Mule event
- D. The payload and all variables

Answer: D

NEW QUESTION # 102

Refer to the exhibits. What payload is logged at the end of the main flow?

- A. [order1, order2, order3, order4]
- B. order4
- C. order1order2order3order4
- D. [1, 2, 3, 4]

Answer: D

Explanation:

For Each Scope

The For Each scope splits a payload into elements and processes them one by one through the components that you place in the scope. It is similar to a for-each/for loop code block in most programming languages and can process any collection, including lists and arrays. The collection can be any supported content type, such as application/json, application/java, or application/xml.

General considerations about the For Each scope:

By default, For Each tries to split the payload. If the payload is a simple Java collection, the For Each scope can split it without any configuration. The payload inside the For Each scope is each of the split elements. Attributes within the original message are ignored because they are related to the entire message.

For Each does not modify the current payload. The output payload is the same as the input.

Mule Doc Reference : <https://docs.mulesoft.com/mule-runtime/4.3/for-each-scope-concept>

NEW QUESTION # 103

According to Semantic Versioning, which version would you change for incompatible API changes?

- A. No change
- B. MINOR
- C. PATCH
- D. MAJOR

Answer: D

Explanation:

Correct answer is MAJOR

MAJOR version when you make incompatible API changes, MINOR version when you add functionality in a backwards compatible manner, and PATCH version when you make backwards compatible bug fixes.

For details refer to this documentation : <https://semver.org/>

NEW QUESTION # 104

A shopping API contains a method to look up store details by department To get information for a particular store, web clients will submit requests with a query parameter named department and a URI parameter named storeId.

What is a valid RAML snippet that supports requests from web clients to get data for a specific storeId and department name?

- A.

```
/department:  
  get:  
    uriParameters:  
      storeId:
```
- B.

```
/({storeId}):  
  get:  
    queryParameters:  
      department:
```
- C.

```
get:  
  queryParameters:  
    department:  
  uriParameters:  
    storeId:
```
- D.

```
get:  
  uriParameters:  
    {storeId}:  
  queryParameters:  
    department:
```

Answer: B

Explanation:

Lets revise few concepts RAML which can help us to find the answer of this question.

URI Parameters

Lets have a look at below example.

/foos:

/ {id}:

/name/ {name}:

Here, the braces { } around property names define URI parameters. They represent placeholders in each URI and do not reference root-level RAML file properties as we saw above in the baseUri declaration. The added lines represent the resources /foos/ {id} and /foos/name/ {name}.

Query Parameters

Now we'll define a way to query the foos collection using query parameters. Note that query parameters are defined using the same syntax that we used above for data types:

/foos:

get:

description: List all Foos matching query criteria, if provided;

otherwise list all Foos

queryParameters:

name?: string

ownerName?: string

Based on the above information , below is the only option which defines storeId as uri parameter and department as query parameter.

/ {storeId}:

get:

queryParameter:

department:

NEW QUESTION # 105

.....

To keep the Salesforce-MuleSoft-Developer-I practice questions in Salesforce PDF format up to date, we regularly update them to according to changes in the real Salesforce-MuleSoft-Developer-I exam content. This dedication to keep Salesforce Certified MuleSoft Developer (Mule-Dev-201) (Salesforce-MuleSoft-Developer-I) exam questions relevant to the Salesforce-MuleSoft-Developer-I actual test domain ensures that customers always get the most up-to-date Salesforce Salesforce-MuleSoft-Developer-I questions from TrainingDump.
