Exam AP-202 Score - Practice AP-202 Exams

Get the test AP-202 certification is not achieved overnight, we need to invest a lot of time and energy to review, and the review process is less a week or two, more than a month or two, or even half a year, so AP-202 exam questions are one of the biggest advantage is that it is the most effective tools for saving time for users. Users do not need to spend too much time on AP-202 questions torrent, only need to use their time pieces for efficient learning, the cost is about 20 to 30 hours, users can easily master the test key and difficulties of questions and answers of AP-202 Prep Guide, and in such a short time acquisition of accurate examination skills, better answer out of step, so as to realize high pass the qualification test, has obtained the corresponding qualification certificate.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q87-Q92):

NEW QUESTION # 87

What is the purpose of `connectedCallback` in a Lightning web component?

- A. It performs actions when a network request is made.
- B. It performs actions when a component is added to the DOM.
- C. It perform actions when a component makes a call to a Connect APL.
- D. It performs actions when a component is removed from the DOM.

Answer: B

Explanation:

The `connectedCallback` is a lifecycle hook that is invoked when a Lightning web component is inserted into the DOM. It is used to perform any initialization tasks that depend on the component being rendered, such as fetching data, setting up event listeners, or

creating timers. The `connectedCallback` can fire more than once, for example, when a component is moved or rerendered. The `connectedCallback` should not be used to change the state of a component, such as loading values or setting properties. Use getters and setters instead. The other options are incorrect because they do not describe the purpose of the `connectedCallback`. Lifecycle Hooks | Lightning Web Components Developer Guide, `connectedCallback()` in Lightning Web Component - Salesforce Diaries, Chapter 23: `connectedCallback()` in Lightning Web Component

NEW QUESTION # 88

Which two practices are allowed when it comes to naming a Lightning Web Components folder and associated files?

- A. Beginning with a lowercase letter
- B. Using a single hyphen (dash)
- C. Using a single underscore
- D. Including whitespace

Answer: A,B

Explanation:

When naming a Lightning Web Components folder and associated files, Salesforce best practices allow the name to begin with a lowercase letter and to use a single hyphen (dash) for compound names. Whitespace and underscores are not recommended in the naming convention. This is in line with web standards for custom elements. More details can be found in the Salesforce LWC documentation on naming conventions: Salesforce LWC Naming Conventions.

NEW QUESTION # 89

A developer needs to implement a business rule around shipping: Anything over a certain amount must be sent through freight at a fixed cost and cannot be sent through standard shipping channels. Which two considerations should the developer consider?

- A. The implementing class may need to contain logical branching
- B. The implementing class cannot call out to another service
- C. A class will need to implement the `sfdc_commerce.CartShippingCharges` interface
- D. A class will need to implement the `sfdc_checkout.CartShippingCharges` interface

Answer: A,C

Explanation:

The correct answer is A and D. To implement a business rule around shipping, the developer will need to create a class that implements the `sfdc_commerce.CartShippingCharges` interface and may need to contain logical branching to handle different scenarios^{1,2}. The `sfdc_commerce.CartShippingCharges` interface is a standard interface that defines the methods for calculating shipping charges for a cart¹. The developer can use this interface to override the default shipping logic and apply custom rules based on the cart amount or other factors^{1,2}. The developer may also need to use conditional statements or other logic to determine when to use freight shipping or standard shipping³.

The implementing class cannot call out to another service and a class will need to implement the `sfdc_checkout.CartShippingCharges` interface are not the correct answers. The implementing class can call out to another service if needed, such as an external shipping service or a pricing engine². The `sfdc_checkout.CartShippingCharges` interface is a deprecated interface that was used for calculating shipping charges for a cart only¹. It has been replaced by the `sfdc_commerce.CartShippingCharges` interface, which supports both carts and orders¹. Reference:

NEW QUESTION # 90

Which method is used to override when extending the Salesforce B2B Commerce logic providers?

- A. `fetch`
- B. `doLogic`

- C. doAction
- D. process

Answer: C

Explanation:

The method that is used to override when extending the Salesforce B2B Commerce logic providers is doLogic. This method is responsible for executing the business logic for each logic provider class, such as validating inputs, performing calculations, applying rules, or updating data. By overriding this method, the user can modify or extend the existing logic or add their own custom logic. Salesforce B2B Commerce and D2C Commerce Developer Guide, Logic Classes

NEW QUESTION # 91

In a B2B Commerce store, which three tasks must a developer complete to implement the use of a third-party service for either tax, shipping, or pricing calculation?

- A. Create a flow to call the external service directly
- B. Create an Apex class implementing the appropriate interface.
- C. Create a named credential for authentication with an external service
- D. Register an Apex class as the integration in the store administration
- E. Create an Apex class with an invocable method

Answer: B,C,D

Explanation:

To implement the use of a third-party service for either tax, shipping, or pricing calculation in a B2B Commerce store, a developer must complete these three tasks:

Create an Apex class that implements the appropriate interface for the calculation type. For example, for tax calculation, the developer must implement the `sfdc_checkout.CartTax` interface and define the `getTax` method. This method takes a `Cart` object as an input parameter and returns a list of `CartTax` objects with the calculated tax amounts.

Create a named credential for authentication with the external service. A named credential specifies the URL of a callout endpoint and its required authentication parameters. The developer can use the named credential in the Apex class to make the callout to the external service and handle the response.

Register the Apex class as the integration in the store administration. The developer must specify the Apex class name in the corresponding field for the calculation type. For example, for tax calculation, the developer must enter the Apex class name in the Tax Calculation Integration field. This way, the store can invoke the Apex class to perform the calculation for each cart.

The other options are not valid tasks for implementing the use of a third-party service. Creating a flow to call the external service directly is not supported for B2B Commerce, and creating an Apex class with an invocable method is not required for the calculation integration. Reference:

Integrate with External Services

CartTax Interface

Named Credentials
