值得信任的010-160考試重點 |第一次嘗試輕鬆學習並通過考試和有用的Lpi Linux Essentials Certificate Exam - version 1.6

當你感到悲哀痛苦時，最好是去學東西，學習會使你永遠立於不敗之地。PDFExamDumps Lpi的010-160考試培訓資料同樣可以幫助你立於不敗之地。有了這個培訓資料，你將獲得國際上認可及接受的Lpi的010-160認證，這樣你的全部生活包括金錢地位都會提升很多，到那時，你還會悲哀痛苦嗎？不會，你會很得意，你應該感謝PDFExamDumps網站為你提供這樣一個好的培訓資料，在你失落的時候幫助了你，讓你不僅提高自身的素質，也幫你展現了你完美的人生價值。

最新的 LPI Linux Essentials 010-160 免費考試真題 (Q34-Q39):

問題 #34

Which of the following directories must be mounted with read and write access if it resides on its own dedicated file system?

- A. /usr
- **B. /var**
- C. /etc
- D. /lib
- E. /opt

答案： B

問題 #35

What information can be displayed by top?

- A. Existing files, ordered by their size.
- B. User groups, ordered by the number of members.
- C. User accounts, ordered by the number of logins.
- **D. Running processes, ordered by CPU or RAM consumption.**
- E. User accounts, ordered by the number of files.

答案： D

解題說明：

The top command is a Linux command that shows the running processes on the system. It provides a dynamic real-time view of the system performance and resource usage. The top command can display various information about the processes, such as their process ID, user, priority, state, CPU and memory usage, command name, and more. The top command can also sort the processes by different criteria, such as CPU or RAM consumption, by using the interactive commands. The top command is useful for monitoring the system load and identifying the processes that are consuming the most resources. Reference: Linux Essentials Topic 104: The Linux Operating System, section 104.3: Basic features and commands of the Linux standard shells. Linux Essentials Topic 106: Security and File Permissions, section 106.4: Monitor and manage Linux processes.

問題 #36

What is true about the dmesg command? (Choose two correct answers.)

- A. It displays the content of the Linux kernel's ring buffer.
- B. It sends messages to the command lines of all current user sessions.
- C. It might not display older information because it was overwritten by newer information.
- D. It immediately outputs all new messages written to the system journal.
- E. It traces the execution of a command and shows each step the program carries out.

答案： A,C

解題說明：

The dmesg command is used to display the messages from the kernel that are stored in a ring buffer. A ring buffer is a fixed-size data structure that overwrites the oldest entries when it is full. Therefore, the dmesg command might not display older information because it was overwritten by newer information. The dmesg command is useful for troubleshooting system issues and checking hardware information. The dmesg command is not used to trace the execution of a command, send messages to user sessions, or output the system journal. Those functions are performed by other commands such as strace, write, and journalctl respectively. Reference: : [dmesg] : [Ring buffer] : [strace] : [write (Unix)] : [journalctl][4]

問題 #37

Which of the following statements regarding Linux hardware drivers is correct?

- A. Drivers are regular Linux programs which have to be run by the user who wants to use a device.
- B. Drivers are downloaded from the vendor's driver repository when a new device is attached.
- C. Drivers are stored on their devices and are copied by the Linux kernel when a new device is attached.
- D. Drivers are not used by Linux because the BIOS handles all access to hardware on behalf of Linux.
- E. Drivers are either compiled into the Linux kernel or are loaded as kernel modules.

答案： E

解題說明：

Explanation

Linux hardware drivers are software components that enable the Linux kernel to communicate with various devices, such as keyboards, mice, printers, scanners, network cards, etc. Drivers are either compiled into the Linux kernel or are loaded as kernel modules. Kernel modules are pieces of code that can be loaded and unloaded into the kernel on demand. They extend the functionality of the kernel without requiring to rebuild or reboot the system. Drivers that are compiled into the kernel are always available, but they increase the size and complexity of the kernel. Drivers that are loaded as kernel modules are only available when needed, but they require a matching version of the kernel and the module. Linux supports a large number of hardware devices, thanks to the efforts of the open source community and some vendors who provide drivers for their products.

However, some devices may not have a driver available for Linux, or may require a proprietary driver that is not included in the Linux distribution. In such cases, the user may need to install the driver manually from the vendor's website or from a third-party repository. References:

問題 #38

What is true about links in a Linux file system?

- A. Only the root user can create hard links.

- B. When the target of the symbolic link is moved, the link is automatically updated.
- **C. A symbolic link can point to a file on another file system**
- D. A symbolic link can only point to a file and not to a directory.
- E. A hard link can only point to a directory and never to a file.

答案： C
