Peoplecert PeopleCert DevOps Site Reliability Engineer (SRE) Sample Questions (Q19-Q24):

NEW QUESTION # 19

Which of the following BEST completes the definition of a canary release?

"A new set of features is released..."

- A. first to a small group of users
- B. using a rolling wave technique
- C. first to a trial test environment
- D. to one small group after another

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

SRE and DevOps release engineering define a canary release as rolling out new features to a small subset of users to validate reliability and performance before full release. The SRE Book states: "Canarying is the practice of releasing changes to a small percentage of users or servers first to detect issues before global rollout." This minimizes risk by catching regressions early without impacting the entire user base.

Option B fits this definition exactly.

Option A (rolling wave) is a deployment pattern but not canarying.

Option C resembles phased rollout but not specifically canary release.

Option D describes testing, not production canary deployment.

Thus, B is correct.

NEW QUESTION # 20

Which of the following is the MOST likely outcome when the workforce puts the 'parts1 before the wrote'?"

- A. A focus on common interests and lesser conflicts
- B. Increased introversion and decreased efficiency
- C. A voluntary sharing of resources and information
- D. Increased employee motivation and morale

Answer: B

NEW QUESTION # 21

Which of the following BEST defines a Service Level Indicator (SLI)?

- A. A subjective assessment of the performance aspects of the level of service required
- B. A quantitative target value for aspects of the level of service that are provided
- C. A quantitative measure of some aspect of the level of service that is provided
- D. A subjective measure of the consequences if the level of service is not achieved

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Google's definition is explicit: "An SLI is a carefully defined QUANTITATIVE measure of some aspect of the level of service provided." (SRE Book - Chapter: Service Level Objectives). Examples include error rate, latency, throughput, and availability. SLIs are measurements, not targets-targets are SLOs.

Option D repeats Google's definition almost exactly.

Option C incorrectly describes an SLO (a target), not an SLI.

Options A and B mention subjective assessments-SRE explicitly rejects subjectivity in measurement, stating: "SLIs must be objective and measurable." Thus, D is the correct and SRE-authentic answer.

NEW QUESTION # 22

An organization is experiencing significant turnover of IT operational staff with most not staying more than one year. The HR Director and IT Director are trying to determine why they are having difficulty retaining IT operations professionals. What could be one of the reasons?

- A. More time spent managing the backlog than fixing problems
- **B. All of the above**
- C. Lack of time for skills development
- D. Overload and disruptive work patterns

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

High turnover in IT operations roles is often driven by a combination of factors, not just one. The Google SRE Book, Chapter "Eliminating Toil," outlines that excessive toil, unpredictable work, and overload contribute to burnout and churn:

"Excessive operational workload and interrupt-driven work lead to burnout and high attrition among engineering and operational staff." The SRE Workbook adds:

"Teams overwhelmed with toil struggle to innovate, automate, or develop new skills, creating frustration and increasing turnover."

Each option listed represents a recognized driver of burnout in SRE and operations environments:

- * Overload and disruptive work patterns are known contributors to burnout.
- * Lack of time for skills development demotivates engineers and prevents career growth.
- * Backlog-driven cultures force teams into reactive rather than proactive work.

The combination of these factors matches common causes of attrition in operations teams. Therefore, all of the above is the correct answer.

NEW QUESTION # 23

Which of the following BEST explains how an error budget allows for a maximum change velocity?

- A. Developers focus only on new feature work versus operational work if the budget is empty.
- B. Developers rush to do development work if the budget is high and slow down when it is low.
- **C. Developers can focus on pushing out feature changes until the error budget remains high.**
- D. Developers must slow down feature changes in line with the percentage the budget is used.
