Therefore, you will need them if you desire to ace the B2B Commerce for Developers Accredited Professional (AP-202) exam in a short time.

## Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q17-Q22):

### NEW QUESTION # 17

A developer needs to implement specific styling for a standard component on a single page of the B2B Commerce store using an Aura template. The component should use the default style on all other pages. How should the developer implement the required changes over multiple instances?

- A. Create a Custom Theme Layout Aura component that imports the custom CSS file. Set up the page to use this Theme Layout.
- B. Create a Custom Content Layout Lightning web component that imports the custom CSS file. Set up the page to use this Content Layout.
- C. Use a Custom CSS file in a static resource and add the import using the Edit Head Markup Editor in the Experience

Builder.

- D. Use the Override CSR Editor in the Experience Builder and add the desired CSS to change the styles.

**Answer: A**

Explanation:

To implement specific styling for a standard component on a single page of the B2B Commerce store using an Aura template, a developer should create a custom theme layout Aura component that imports the custom CSS file and set up the page to use this theme layout. A theme layout is a type of Aura component that defines the header and footer of a page in the storefront. A theme layout can also import custom CSS files from static resources and apply them to the page. A developer can create a custom theme layout Aura component that imports the custom CSS file that contains the specific styling for the standard component and assign it to the page that needs the custom styling. This way, the custom styling will only affect the standard component on that page and not on other pages that use a different theme layout. Using a custom CSS file in a static resource and adding the import using the Edit Head Markup Editor in the Experience Builder is not a valid way to implement specific styling for a standard component on a single page, as it will affect all pages that use the same template. Creating a custom content layout Lightning web component that imports the custom CSS file and setting up the page to use this content layout is not a valid way either, as it will not affect the standard component that is outside of the content layout. Using the Override CSR Editor in the Experience Builder and adding the desired CSS to change the styles is not a valid way either, as it will affect all pages that use the same template. Salesforce B2B Commerce Developer Guide: Theme Layout Component, B2B Commerce Developer Guide: Content Layout Component, B2B Commerce Developer Guide: Override CSR Editor

#### NEW QUESTION # 18

Which two aspects are applicable to Page Includes? (2 answers)

- A. Page Includes can be configured as Body Includes Begin.
- B. If a controller is used for an included page, then a merge variable must be present on the page.
- C. Page Includes must be assigned to an OOTB Page, i.e. Home, Product Detail, etc., and enabled
- D. Standard Visualforce controls such as apex:form should not be used within a page include

**Answer: A,D**

Explanation:

Two aspects that are applicable to Page Includes are:

Standard Visualforce controls such as apex:form should not be used within a page include. This is because the page include is rendered inside an existing Visualforce page that already has a form element. Using another form element inside the page include will cause conflicts and errors. Instead, the page include should use HTML elements or custom components that do not require a form element.

Page Includes can be configured as Body Includes Begin. This means that the page include will be rendered at the beginning of the body section of the page, before any other content or widgets. This can be useful for adding some custom content or functionality that applies to the whole page, such as a banner, a modal, or a script. Salesforce B2B Commerce and D2C Commerce Developer Guide, Page Includes

#### NEW QUESTION # 19

Which tool is used to retrieve and manipulate Salesforce data in a Lightning Web Component?

- A. XHR requests
- B. Proxy adapters
- C. Aura requests
- D. Wire adapters

**Answer: D**

Explanation:

In Lightning Web Components, wire adapters are used to retrieve and manipulate Salesforce data. Wire adapters abstract the underlying data access mechanism, providing a declarative way to access Salesforce data and metadata. Salesforce documentation on LWC and the @wire decorator details how wire adapters can be used to connect components to Salesforce data sources, including standard and custom objects, facilitating reactive data binding and efficient data retrieval.

### NEW QUESTION # 20

What is true regarding adding more Configuration Settings to Salesforce B2B Commerce?

- **A. More modules and metadata can be added to Salesforce B2B Commerce.**
- B. Configuration settings can only be extended through API's
- C. Select "New" in your storefront's Configuration Settings and create a custom setting.
- D. Metadata can be added to existing modules, but you cannot add new modules.

**Answer: A**

Explanation:

More modules and metadata can be added to Salesforce B2B Commerce by creating custom configuration settings. Configuration settings are custom settings that store various values and parameters that affect the functionality and appearance of the storefront. They are organized into modules, which group related settings together. To create a custom configuration setting, the user needs to create a custom setting record in Salesforce and specify its module, name, value, and description. The custom setting will then appear in CCAAdmin under the specified module. Salesforce B2B Commerce and D2C Commerce Developer Guide, Configuration Settings

### NEW QUESTION # 21

What is true about mapping custom fields from Cart to Order Summary?

- **A. A custom field must exist in the Cart and Order Summary objects only to be mapped successfully.**
- B. All data types are supported for custom fields to be mapped from Cart to Order.
- C. There is a limit of 25 custom fields on a Cart that can be mapped to Order.
- D. The automatic Cart to Order mapping of custom fields can be disabled.

**Answer: A**

Explanation:

The correct answer for what is true about mapping custom fields from Cart to Order Summary is that the automatic Cart to Order mapping of custom fields can be disabled. A custom field is a field that is added by a developer or an administrator to an object to store additional information or data. A Cart is an object that represents a collection of products and charges that a customer intends to purchase in the storefront. An Order Summary is an object that represents a confirmed purchase of products and charges by a customer in the storefront. A Cart can be converted to an Order Summary when the customer completes the checkout process and confirms their order. By default, Salesforce B2B Commerce automatically maps custom fields from Cart to Order Summary when converting a Cart to an Order Summary. This means that any custom fields that exist on both Cart and Order Summary objects with identical API names and data types will have their values copied from Cart to Order Summary during the conversion. The automatic Cart to Order mapping of custom fields can be disabled by setting the B2BCommerce.CartToOrderMappingEnabled custom setting to false. This will prevent any custom fields from being copied from Cart to Order Summary during the conversion. A custom field must exist in the Cart and Order Summary objects only to be mapped successfully is not true, as it is not the only requirement for mapping custom fields from Cart to Order Summary. The custom fields must also have identical API names and data types, and the automatic Cart to Order mapping of custom fields must be enabled. All data types are supported for custom fields to be mapped from Cart to Order is not true, as some data types are not supported for mapping custom fields from Cart to Order Summary. The supported data types are Boolean, Date, DateTime, Double, Integer, Long, Percent, String, and TextArea. There is a limit of 25 custom fields on a Cart that can be mapped to Order is not true, as there is no such limit for mapping custom fields from Cart to Order Summary. Any number of custom fields that meet the mapping requirements can be mapped from Cart to Order Summary.
