3V0-624

**VMware Certified Advanced Professional 6.5 –
Data Center Virtualization Design Exam**

Once you decide to pass the Advanced VMware Cloud Foundation 9.0 vSphere Kubernetes Service exam and get the certification, you may encounter many handicaps that you don't know how to deal with, so, you may think that it is difficult to pass the exam and get the certification. In order to help you solve these problem and help you pass the exam easy, we complied such a 3V0-24.25 exam torrent. We can promise that you will have no regret buying our Advanced VMware Cloud Foundation 9.0 vSphere Kubernetes Service exam dumps. If you are hesitating to buy our 3V0-24.25 Test Quiz, if you are anxious about whether our product is suitable for you or not, we think you can download the trail version. We believe our Advanced VMware Cloud Foundation 9.0 vSphere Kubernetes Service exam dumps will help you make progress and improve yourself.

Although a lot of products are cheap, but the quality is poor, perhaps users have the same concern for our latest 3V0-24.25 exam dump. Here, we solemnly promise to users that our product error rate is zero. Everything that appears in our products has been inspected by experts. In our 3V0-24.25 practice materials, users will not even find a small error, such as spelling errors or grammatical errors. It is believed that no one is willing to buy defective products, so, the 3V0-24.25 Study Guide has established a strict quality control system. The entire compilation and review process for latest 3V0-24.25 exam dump has its own set of normative systems, and the 3V0-24.25 practice materials have a professional proofreader to check all content. Only through our careful inspection, the study material can be uploaded to our platform. So, please believe us, 0 error rate is our commitment.

VMware Advanced VMware Cloud Foundation 9.0 vSphere Kubernetes Service Sample Questions (Q63-Q68):

NEW QUESTION # 63

A Security Operations Analyst needs to configure access for an external OIDC provider (e.g., Okta) to allow developers to authenticate to TKG clusters.

Review the available configuration interfaces:

1. vSphere Client > Administration > Single Sign-On > Configuration > Identity Provider
2. Supervisor Control Plane VM (via SSH) > /etc/pam.d/
3. NSX Manager > System > Users > External
4. Tanzu Mission Control > Identity

Where must the analyst configure the upstream OIDC Identity Provider trust relationship so that it applies to the Supervisor Cluster and its Namespaces?

- A. Interface 4

- B. Interface 2
- **C. Interface 1**
- D. Interface 3

Answer: C

NEW QUESTION # 64

Which of the following best describes the primary function of a vSphere Namespace within a vSphere with Tanzu environment?

- A. It is a networking construct that provides isolation at Layer 2 for TKG clusters.
- B. It is a construct that maps 1:1 to a vCenter Server cluster for high availability.
- **C. It is a resource boundary backed by a Resource Pool that allows vSphere administrators to set limits on CPU, memory, and storage for a set of Kubernetes workloads.**
- D. It is a logical boundary that encapsulates a set of virtual machines for resource management.

Answer: C

NEW QUESTION # 65

A customer is required to enhance the security for a set of VMware vSphere Kubernetes Service (VKS) clusters that host services interacting with sensitive customer data. The solution must encrypt the transport and communications between services. The VKS Admin recommends enabling Istio Service Mesh to satisfy the requirement. What type of encryption does Istio Service Mesh provide?

- A. SSH or TLS
- **B. mTLS**
- C. IPsec with IKEv2
- D. AES 256

Answer: B

Explanation:

Istio is available in VCF 9.0 as an optional package that can be installed for VKS clusters. The VCF 9.0 documentation explicitly lists "Istio" among the optional packages that "can be optionally installed" for the vSphere Kubernetes Service (VKS). In Kubernetes platforms, Istio is a service mesh that secures and manages service-to-service (east-west) traffic by establishing authenticated and encrypted connections between workloads. The encryption mechanism it provides for inter-service communication is mutual TLS (mTLS), which means both ends (client and server workloads) authenticate each other and negotiate encrypted transport for every service call meeting the requirement to "encrypt the transport and communications between services." This is distinct from host-level mechanisms like IPsec/IKEv2 (network-layer) or "AES-256" (an algorithm, not the service-to-service transport model). Enabling Istio Service Mesh is therefore aligned to deliver encrypted, identity-aware service communications across the cluster at the application service layer.

NEW QUESTION # 66

A VKS Administrator wants to Uninstall a Supervisor Service (e.g., a test instance of MinIO) to free up resources. What is the impact of uninstalling a service on the Persistent Data associated with it (e.g., the MinIO buckets)?

- A. The data remains on the datastore as orphaned VMDKs.
- B. By default, the uninstall workflow deletes the Service Instance and its compute resources (Pods), but the Persistent Volume Claims (PVCs) and the underlying data are typically Retained (unless the specific service operator logic or a "Force Delete" option effectively purges them, but standard K8s practice for stateful sets often leaves PVCs to prevent accidental data loss). Self-Correction: In the vSphere Client workflow for Supervisor Services, "Remove" typically deletes the SupervisorService CR. The behavior depends on the Operator managing it. However, vSphere often warns that data might be lost or asks. A key exam point is understanding that Uninstall removes the active logic. But usually, for Supervisor Services specifically, it cleans up the namespace created for the service instance.
- C. The service is paused, but data is kept.
- D. The data is archived to the Content Library.
- **E. The Uninstall operation deletes the dedicated vSphere Namespace created for that service instance, which permanently**

deletes all Pods, Secrets, and Persistent Volumes (Data) contained within it.

Answer: E

NEW QUESTION # 67

A VKS Administrator needs to configure a TKG cluster to support taking snapshots of persistent volumes backed by vSAN. Review the following VolumeSnapshotClass manifest being prepared:

```
apiVersion: snapshot.storage.k8s.io/v1
kind: VolumeSnapshotClass
metadata:
  name: csi-vsphere-snapclass
  driver: csi.vsphere.vmware.com
  deletionPolicy: Delete
```

Which additional step is required to ensure this class is usable by developers in the default namespace?

- A. The vSphere CSI driver must be manually installed via Helm.
- **B. No additional steps are required; VolumeSnapshotClass is a cluster-scoped resource, making it available to all namespaces once applied.**
- C. A RoleBinding must be created to grant the default ServiceAccount use access to this class.
- D. The class must be assigned to the vSphere Namespace in the vSphere Client.

Answer: B
